Sandia National Laboratories
Albuquerque, NM 87185

Abstract

EXODUS II is a model developed to store and retrieve data for finite element analyses. It is used for preprocessing (problem definition), postprocessing (results visualization), as well as code to code data transfer. An EXODUS II data file is a random access, machine independent, binary file that is written and read via C, C++, or Fortran library routines which comprise the Application Programming Interface (API).

1 Introduction

EXODUS II is the successor of the widely used finite element (FE) data file format EXODUS [1] (henceforth referred to as EXODUS I) developed by Mills-Curran and Flanagan. It continues the concept of a common database for multiple application codes (mesh generators, analysis codes, visualization software, etc.) rather than code-specific utilities, affording flexibility and robustness for both the application code developer and application code user. By using the EXODUS II data model, a user inherits the flexibility of using a large array of application codes (including vendor-supplied codes) which access this common data file directly or via translators.

The uses of the EXODUS II data model include the following, as illustrated in Figure 1:

- Problem definition -- mesh generation, specification of locations of boundary conditions and load application, specification of material types.
- Simulation -- model input and results output.
- Visualization -- model verification, results postprocessing, data interrogation, and analysis tracking.

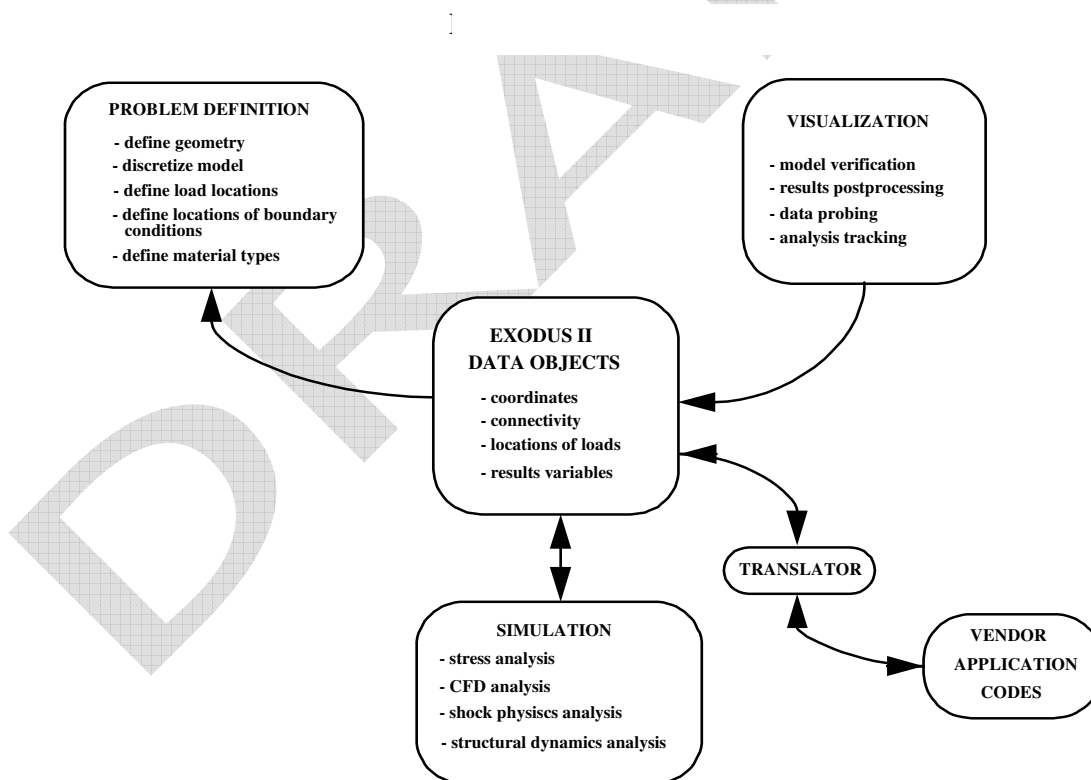

Figure 1. Uses of EXODUSII

2 Changes Since First Printing

There have been several changes to the ExodusII API in the 12 years since the original ExodusII report was published. The main changes are:

- Addition of Coordinate Frames
- Addition of node set and side set results variables.
- Addition of element block, node set, side set, element map, and node map names.
- Addition of element block attribute names.
- Support for very large models.
- Efficient replication of the model definition “genesis” portion of the database.
- Multiple, optional named node and element maps which can be used for any purpose.
- Support for “meshes” with no nodes or elements; or nodes, but no elements.

There have also been some functions added to make it easier to write an exodusII database efficiently. These include:

- API function to write concatenated element block information, and
- API function to define all results data with one call.

The following API functions have been added:

ex_copy	Section 5.2.57
ex_get_coordinate_frames	Section 5.2.45
ex_get_elem_attr_names	Section 5.2.22
ex_get_name	Section 5.2.49

```

In addition, there have been many changes to the source code to improve robustness and efficiency.

DRAFT

3 Development of EXODUS II

The evolution of the EXODUS data model has been steered by FE application code developers who desire the advantages of a common data format. The EXODUS II model has been designed to overcome deficiencies in the EXODUS I file format and meet the following functional requirements as specified by these developers:

- Random read/write access.
- Application programming interface (API) -- provide routines callable from FORTRAN, C, and C++ application codes.
- Extensible -- allow new data objects to be added without modifying the application programs that use the file format.
- Machine independent -- data should be independent of the machine which generated it.
- Real-time access during analysis -- allow access to the data in a file while the file is being created.

To address these requirements, the public domain database library netCDF [3] was selected to handle the low-level data storage. The EXODUS II library functions provide the mapping between FE data objects and netCDF dimensions, attributes, and variables. (These mappings are documented in Appendix A.) Thus, the code developer interacts with the data model using the vocabulary of an FE analyst (element connectivity, nodal coordinates, etc.) and is relieved of the details of the data access mechanism. To provide machine independency, the netCDF library stores data in eXternal Data Representation (XDR) [4] format.

Because an EXODUS II file is a netCDF file, an application program can access data via the EXODUS II API or the netCDF API directly. This functionality is illustrated in Figure 2. Although accessing the data directly via the netCDF API requires more in-depth understanding of netCDF, this capability is a powerful feature that allows the development of auxiliary libraries of special purpose functions not offered in the standard EXODUS II library. For example, if an application required access to the coordinates of a single node (the standard library function returns the coordinates for all of the nodes in the model), a simple function could be written that calls netCDF routines directly to read the data of interest.

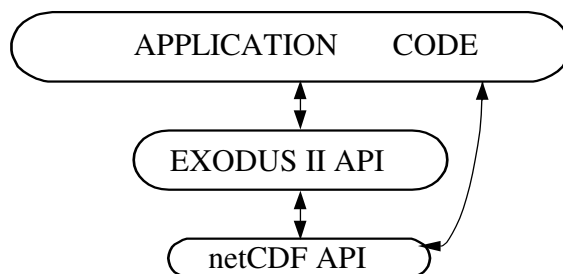

Figure 2 ExodusII Implementation

4 Description of Data Objects

The data in EXODUS II files can be divided into three primary categories: initialization data, model, and results.

Initialization data includes sizing parameters (number of nodes, number of elements, etc.), optional quality assurance information (names of codes that have operated on the data), and optional informational text.

The model is described by data which are static (do not change through time). This data includes nodal coordinates, element connectivity (node lists for each element), element attributes, and node sets and side sets (used to aid in applying loading conditions and boundary constraints).

The results are optional and include five types of variables -- nodal, element, nodeset, sideset, and global -- each of which is stored through time. Nodal results are output (at each time step) for all the nodes in the model. An example of a nodal variable is displacement in the X direction. Element, nodeset, and sideset results are output (at each time step) for all entities (elements, nodes, sides) in one or more entity block. For example, stress may be an element variable. Another use of element variables is to record element status (a binary flag indicating whether each element is “alive” or “dead”) through time. Global results are output (at each time step) for a single element or node, or for a single property. Linear momentum of a structure and the acceleration at a particular point are both examples of global variables. Although these examples correspond to typical FE applications, the data format is flexible enough to accommodate a spectrum of uses.

A few conventions and limitations must be cited:

- There are no restrictions on the frequency of results output except that the time value associated with each successive time step must increase monotonically.
- To output results at different frequencies (i.e., variable A at every simulation time step, variable B at every other time step) multiple EXODUS II files must be used.
- There are no limits to the number of each type of results, but once declared, the number cannot change.
- If the mesh geometry or topology changes in time (i.e., number of nodes increases, connectivity changes), then the new geometry must be output to a new EXODUS II file.

The following sections describe the data objects that can be stored in an EXODUS II file. API functions that read / write the particular objects are included for reference. API routines for the C binding are in lower case; functions for the Fortran binding are in upper case. Refer to Application Programming Interface (API) for a detailed description of each API function.

4.1 Global Parameters

API functions: `ex_put_init, ex_get_init; EXPINI, EXGINI`

Every EXODUS II file is initialized with the following parameters:

- Title -- data file title of length `MAX_LINE_LENGTH` (`MXLNLN` in Fortran). Refer to discussion below for definition of `MAX_LINE_LENGTH`.
- Number of nodes -- the total number of nodes in the model.
- Problem dimension -- the number of spatial coordinates per node (1, 2, or 3).
- Number of elements -- the total number of elements of all types in the file.
- Number of element blocks -- within the EXODUS data model, elements are grouped together into blocks. Refer to Element Blocks for a description of element blocks.
- Number of node sets -- node sets are a convenient method for referring to groups of nodes. Refer to Nod for a description of node sets.
- Number of side sets -- side sets are used to identify elements (and their sides) for specific purposes. Refer to Sid for a description of side sets.
- Database version number -- the version of the data objects stored in the file.
- API version number -- the version of the EXODUS library functions which stored the data in the file. The API version can change without changing the database version and vice versa.
- I/O word size -- indicates the precision of the floating point data stored in the file. Currently, four- or eight-byte floating point numbers are supported. It is not necessary that an application code be written to handle the same precision as the data stored in the file. If required, the routines in the EXODUS II library perform automatic conversion between four- and eight-byte numbers.
- Length of character strings -- all character data stored in an EXODUS II file is either of length `MAX_STR_LENGTH` (`MXSTLN` in Fortran) or `MAX_LINE_LENGTH` (`MXLNLN` in Fortran). This allows Fortran application codes to declare the lengths of character variables as predefined constants. These two constants are defined in the file `exodusII.h` (`exodusII.inc` for Fortran). Current values are 32 and 80, respectively.
- Length of character lines -- see description above for length of character strings.

4.2 Quality Assurance Data

API functions: `ex_put_qa, ex_get_qa; EXPQA, EXGQA`

Quality assurance (QA) data is optional information that can be included to indicate which application codes have operated on the data in the file. Any number of QA records can be

included, with each record containing four character strings of length `MAX_STR_LENGTH` (`MXSTLN` in Fortran). The four character strings are the following (in order):

1. Code name -- indicates the application code that has operated on the EXODUS II file.
2. Code QA descriptor -- provides a location for a version identifier of the application code.
3. Date -- the date on which the application code was executed; should be in the format 01/25/93 (MM/DD/YY) or the format 20051104 (CCYYMMDD).
4. Time -- the 24-hour time at which the application code was executed; should be in the format hours:minutes:seconds, such as 16:30:15.

4.3 Information Data

API functions: `ex_put_info, ex_get_info; EXPINF, EXGINF`

This is for storage of optional supplementary text. Each text record is of length `MAX_LINE_LENGTH` (`MXLNLN` in Fortran); there is no limit to the number of text records.

4.4 Nodal Coordinates

API functions: `ex_put_coord, ex_get_coord; EXPCOR, EXGCOR`

The nodal coordinates are the floating point spatial coordinates of all the nodes in the model. The number of nodes and the problem dimension define the length of this array. The node index cycles faster than the dimension index, thus the X coordinates for all the nodes is written before any Y coordinate data are written. Internal node numbers (beginning with 1) are implied from a nodes' place in the nodal coordinates record. See Node Number Map for a discussion of internal node numbers.

4.4.1 Coordinate Names

API functions: `ex_put_coord_names, ex_get_coord_names; EXPCON, EXGCON`

The coordinate names are character strings of length `MAX_STR_LENGTH` (`MXSTLN` in Fortran) which name the spatial coordinates. There is one string for each dimension in the model, thus there are one to three strings.

4.5 Node Number Map

API functions: `ex_put_node_num_map, ex_get_node_num_map, EXPNNM, EXGNNM`

Within the data model, internal node IDs are indices into the nodal coordinate array and internal element IDs are indices into the element connectivity array. Thus, internal node and element numbers (IDs) are contiguous (i.e., 1...number_of_nodes and 1...number_of_elements, respectively). Optional node and element number maps can be stored to relate user-defined node and element IDs to these internal node and element numbers. The lengths of these maps are number_of_nodes and number_of_elements, respectively. As an example, suppose a database contains exactly one QUAD element with four nodes. The user desires the element ID to be 100 and the node IDs to be 10, 20, 30, and 40 as shown in Figure 3.

Node IDs	Node coordinates	
10	0.0	0.0
20	1.0	0.0
30	1.0	1.0
40	0.0	1.0

Figure 3 User-defined Node and Element IDs

The internal data structures representing the above model would be the following:

- nodal coordinate array: (0.0, 1.0, 1.0, 0.0, 0.0, 0.0, 1.0, 1.0)
- connectivity array: (1, 2, 3, 4)
- node number map: (10, 20, 30, 40)
- element number map: (100)

Internal (contiguously numbered) node and element IDs must be used for all data structures that contain node or element numbers (IDs), including node set node lists, side set element lists, and element connectivity. Additionally, to inquire the value(s) of node or element results variables, an application code must pass the internal node or element number for the node or element of interest.

4.6 Element Number Map

API functions: `ex_put_elem_num_map`, `ex_get_elem_num_map`, `EXPENM`, `EXGENM`

Refer to Node Number Map for a discussion of the optional element number map.

4.7 Optimized Element Order Map

API functions: `ex_put_map`, `ex_get_map`; `EXPMAP`, `EXGMAP`

The optional element order map defines the element order in which a solver (e.g., a wavefront solver) should process the elements. For example, the first entry is the number of the element which should be processed first by the solver. The length of this map is the total number of elements in the model.

4.8 Element Blocks

For efficient storage and to minimize I/O, elements are grouped into element blocks. Within an element block, all elements are of the same type (basic geometry and number of nodes). This definition does not preclude multiple element blocks containing the same element type (i.e., “QUAD” elements may be in more than one element block); only that each element block may contain only one element type.

The internal number of an element is defined implicitly by the order in which it appears in the file. Elements are numbered internally (beginning with 1) consecutively across all element blocks. See Node Number Map for a discussion of internal element numbering.

4.8.1 Element Block Parameters

API functions: `ex_put_elem_block`, `ex_get_elem_block`,
`ex_put_concat_elem_block`, `ex_get_elem_blk_ids`; `EXPELB`,
`EXGELB`, `EXPCLB`, `EXGEBI`

The following parameters are defined for each element block:

- Element block ID -- an arbitrary, unique, positive integer which identifies the particular element block. This ID is used as a “handle” into the database that allows users to specify a group of elements to the application code without having to know the order in which element blocks are stored in the file.
- Element type -- a character string of length `MAX_STR_LENGTH` (`MXSTLN` in Fortran) to distinguish element types. All elements within the element block are of this type. Refer to Figure 4 for a list of names that are currently accepted. It should be noted that the EXODUS II library routines do not verify element type names against a standard list; the interpretation of the element type is left to the application codes which read or write the data. In general, the first three characters uniquely identify the element type. Application codes can append characters to the element type string (up to the maximum length allowed) to further classify the element for specific purposes.
- Number of elements -- the number of elements in the element block.
- Nodes per element -- the number of nodes per element for the element block.
- Number of attributes -- the number of attributes per element in the element block. See below for a discussion of element attributes.

4.8.2 Element Connectivity

API functions: `ex_put_elem_conn`, `ex_get_elem_conn`; `EXPELC`, `EXGELC`

The element connectivity contains the list of nodes (internal node IDs; see Node Number Map for a discussion of node IDs) which define each element in the element block. The length of this list is the product of the number of elements and the number of nodes per element as specified in the element block parameters. The node index cycles faster than the element index. Node ordering follows the conventions illustrated in Figure 4, which includes ordering for higher order elements. For lower order elements, simply omit the unused nodes. These node ordering conventions follow the element topology used in PATRAN [5]. Thus, for higher order elements than those illustrated, use the ordering prescribed in the PATRAN User Manual. For elements of type CIRCLE or SPHERE, the topology is one node at the center of the circle or sphere element.

Figure 4 Node Ordering for Standard Element Types

Figure 4 Node Ordering for Standard Element Types

4.8.3 Element Attributes

API functions: `ex_put_elem_attr`, `ex_get_elem_attr`, `ex_put_one_elem_attr`,
`ex_get_one_elem_attr`, `ex_put_elem_attr_names`,
`ex_get_elem_attr_names`; EXPEAT, EXGEAT

Element attributes are optional floating point numbers that can be assigned to each element. Every element in an element block must have the same number of attributes (as specified in the element block parameters) but the attributes may vary among elements within the block. The length of the attributes array is thus the product of the number of attributes per element and the number of elements in the element block. Table 1 lists the standard attributes for the given element types.

Table 1 Element Types and Attributes

Element Type	Attributes
CIRCLE	R
SPHERE	R
TRUSS	A
BEAM	2D: A, I, J 3D: A, I ₁ , I ₂ , J, V ₁ , V ₂ , V ₃
TRIANGLE	
QUAD	
SHELL	T
TETRA	
PYRAMID	
WEDGE	
HEX	

Attribute Descriptions

- A -- cross-sectional area.
- V_i -- a vector that, together with the axis of the element defines a plane for the beam element; I₁ bending moment of inertia affects displacements in this plane; I₂ bending moment of inertia affects bending out of this plane.
- J -- torsional (polar) moment of inertia.
- T -- thickness
- R -- radius

4.9 Node Sets

Node sets provide a means to reference a group of nodes with a single ID. Node sets may be used to specify load or boundary conditions, or to identify nodes for a special output request. A particular node may appear in any number of node sets, but may be in a single node set only once. (This restriction is not checked by EXODUS II routines.) Node sets may be accessed individually (using node set parameters, node set node list, and node set distribution factors) or

in a concatenated format (described in 4.10). The node sets data are stored identically in the data file regardless of which method (individual or concatenated) was used to output them.

4.9.1 Node Set Parameters

API functions: `ex_put_node_set_param, ex_get_node_set_param,`
`ex_get_node_set_ids; EXPNP, EXGNP, EXGNSI`

The following parameters define each node set:

- Node set ID -- a unique integer that identifies the node set.
- Number of nodes -- the number of nodes in the node set.
- Number of distribution factors -- this should be zero if there are no distribution factors for the node set. If there are any distribution factors, this number must equal the number of nodes in the node set since the factors are assigned at each node. Refer to the discussion of distribution factors below.
- Optionally, each node set can have a name. See the functions `ex_put_name`, `ex_put_names`, `ex_get_name`, `ex_get_names`.

4.9.2 Node Set Node List

API functions: `ex_put_node_set, ex_get_node_set; EXPNS, EXGNS`

This is an integer list of all the nodes in the node set. Internal node IDs (see 4.5) must be used in this list.

4.9.3 Node Set Distribution Factors

API functions: `ex_put_node_set_dist_fact, ex_get_node_set_dist_fact;`
`EXPNSD, EXGNSD`

This is an optional list of floating point factors associated with the nodes in a node set. These data may be used as multipliers on applied loads. If distribution factors are stored, each entry in this list is associated with the corresponding entry in the node set node list.

4.10 Concatenated Node Sets

API functions: `ex_put_concat_node_sets, ex_get_concat_node_sets;`
`EXPCNS, EXGCNS`

Concatenated node sets provide a means of writing/reading all node sets with one function call. This is more efficient because it avoids some I/O overhead, particularly when considering the intricacies of the netCDF library. (Refer to Appendix A for a discussion of efficiency concerns.) This is accomplished with the following lists:

- Node sets IDs -- list (of length number of node sets) of unique integer node set ID's. The *i*th entry in this list specifies the ID of the *i*th node set.
- Node sets node counts -- list (of length number of node sets) of counts of nodes for each node set. Thus, the *i*th entry in this list specifies the number of nodes in the *i*th node set.
- Node sets distribution factors counts -- list (of length number of node sets) of counts of distribution factors for each node set. The *i*th entry in this list specifies the number of distribution factors in the *i*th node set.
- Node sets node pointers -- list (of length number of node sets) of indices which are pointers into the node sets node list locating the first node of each node set. The *i*th entry in this list is an index in the node sets node list where the first node of the *i*th node set can be located.
- Node sets distribution factors pointers -- list (of length number of node sets) of indices which are pointers into the node sets distribution factors list locating the first factor of each node set. The *i*th entry in this list is an index in the node sets distribution factors list where the first factor of the *i*th node set can be located.
- Node sets node list -- concatenated integer list of the nodes in all the node sets. Internal node IDs (see 4.5) must be used in this list. The node sets node pointers and node sets node counts are used to find the first node and the number of nodes in a particular node set.
- Node sets distribution factors list -- concatenated list of the (floating point) distribution factors in all the node sets. The node sets distribution factors pointers and node sets distribution factors counts are used to find the first factor and the number of factors in a particular node set.

To clarify the use of these lists, refer to the coding examples in 5.2.30 and 5.2.31.

4.11 Side Sets

Side sets provide a second means of applying load and boundary conditions to a model. Unlike node sets, side sets are related to specified sides of elements rather than simply a list of nodes. For example, a pressure load must be associated with an element edge (in 2-d) or face (in 3-d) in order to apply it properly. Each side in a side set is defined by an element number and a local edge (for 2-d elements) or face (for 3-d elements) number. The local number of the edge or face of interest must conform to the conventions as illustrated in Figure 5.

Figure 5 Side Set Side Numbering

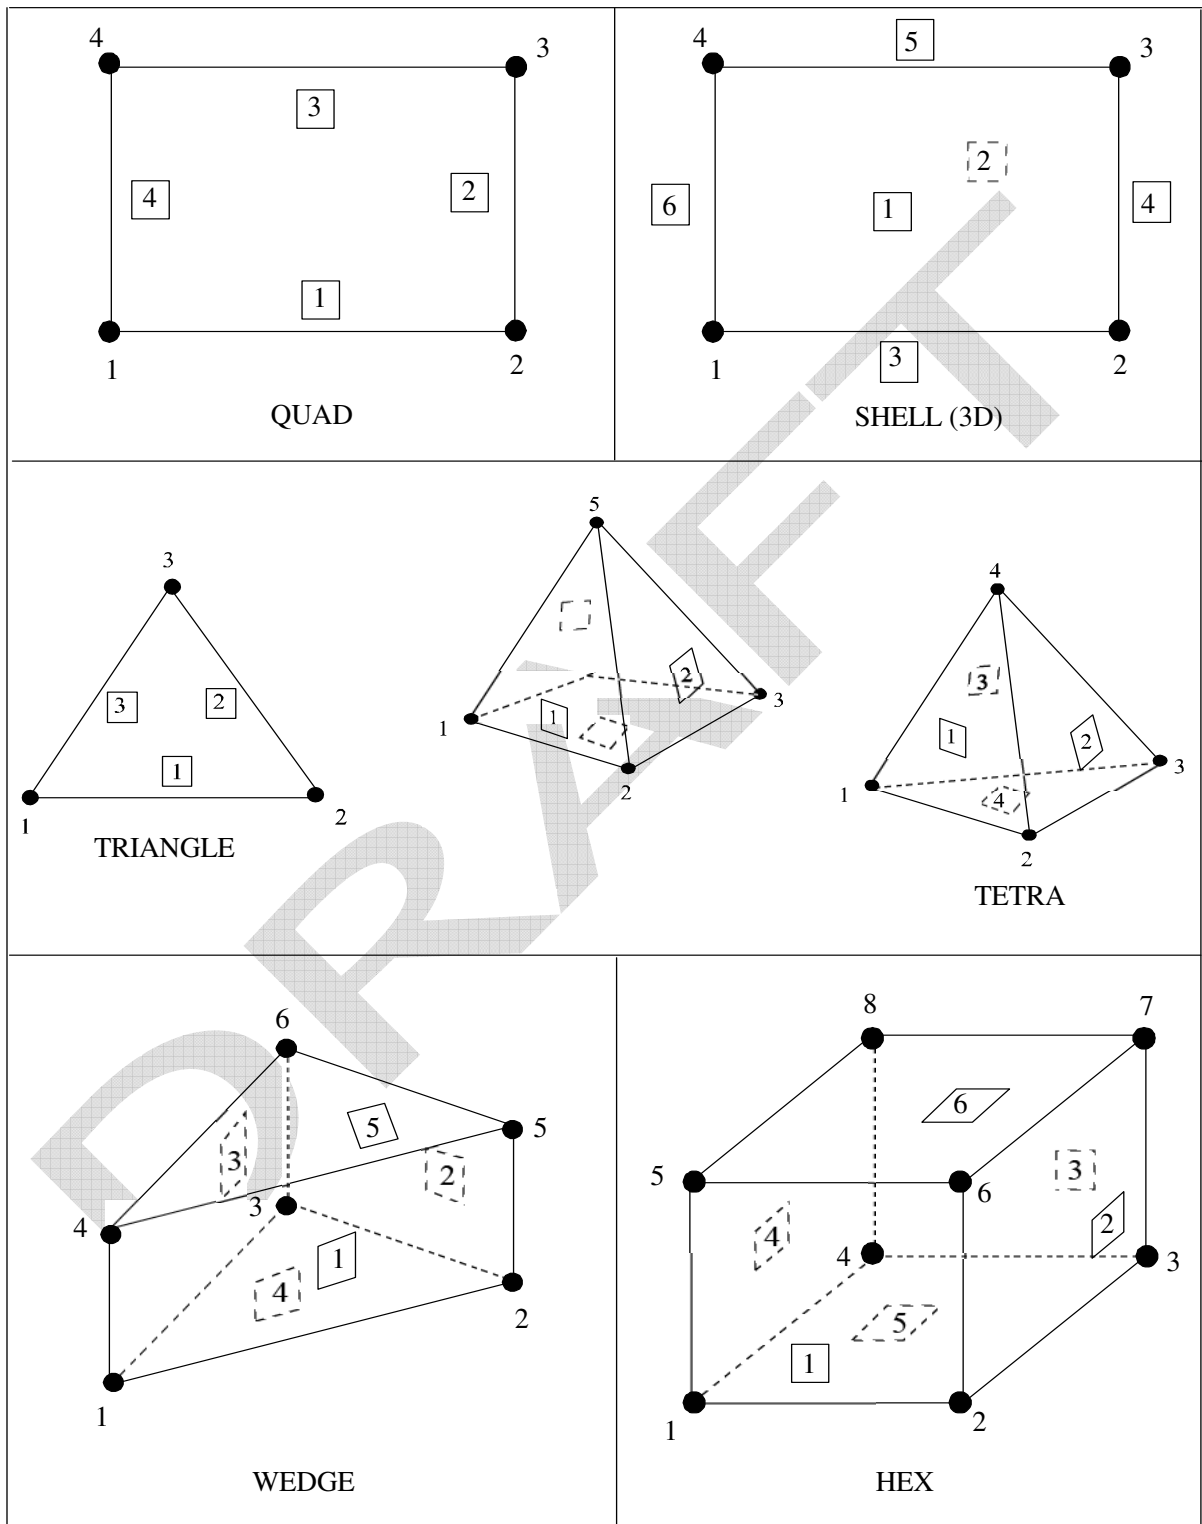

Figure 5 Sideset side Numbering

In this figure, side set side numbers are enclosed in boxes; only the essential node numbers to describe the element topology are shown. A side set may contain sides of differing types of elements that are contained in different element blocks. For instance, a single side set may contain faces of WEDGE elements, HEX elements, and TETRA elements.

4.11.1 Side Set Parameters

API functions: `ex_put_side_set_param, ex_get_side_set_param,`
`ex_get_side_set_ids; EXPSP, EXGSP, EXGSSI`

The following parameters define each side set:

- Side set ID -- a unique integer that identifies the side set.
- Number of sides -- the number of sides in the side set.
- Number of distribution factors -- this should be zero if there are no distribution factors for the side set. If there are any distribution factors, they are assigned at the nodes on the sides of the side set. Refer to the discussion of distribution factors below.
- Optionally, each side set can have a name. See the functions `ex_put_name, ex_put_names, ex_get_name, ex_get_names`.

4.11.2 Side Set Element List

API functions: `ex_put_side_set, ex_get_side_set; EXPSS, EXGSS`

This is an integer list of all the elements in the side set. Internal element IDs (see Node Number Map) must be used in this list.

4.11.3 Side Set Side List

API functions: `ex_put_side_set, ex_get_side_set; EXPSS, EXGSS`

This is an integer list of all the sides in the side set. This list contains the local edge (for 2-d elements) or face (for 3-d elements) numbers following the conventions specified in Figure 5.

4.11.4 Side Set Node List

API functions: `ex_get_side_set_node_list, ex_get_side_set_node_list_len;`
`EXGSSN`

It is important to note that the nodes on a side set are not explicitly stored in the data file, but can be extracted from the element numbers in the side set element list, local side numbers in the side set side list, and the element connectivity array. The node IDs that are output are internal node numbers (see 4.5). They are extracted according to the following conventions:

1. All nodes for the first side (defined by the first element in the side set element list and the first side in the side set side list) are output before the nodes for the second side. There is no attempt to consolidate nodes; if a node is attached to four different faces, then the same node number will be output four times -- once each time the node is encountered when progressing along the side list.
2. The nodes for a single face (or edge) are ordered to assist an application code in determining an “outward” direction. Thus, the node list for a face of a 3-d element proceeds around the face so that the outward normal follows the right-hand rule. The node list for an edge of a 2-d element proceeds such that if the right hand is placed in the plane of the element palm down, thumb extended with the index (and other fingers) pointing from one node to the next in the list, the thumb points to the inside of the element. This node ordering is detailed in Table 2.
3. The nodes required for a first-order element are output first, followed by the nodes of a higher ordered element.

Table 2 Sideset Node Ordering

Table 2 Side Set Node Ordering

Element Type	Side #	Node Order
QUAD	1	1, 2, 5
	2	2, 3, 6
	3	3, 4, 7
	4	4, 1, 8
SHELL	1	1, 2, 3, 4, 5, 6, 7, 8, 9
	2	1, 4, 3, 2, 1, 8, 7, 6, 5, 9
	3	1, 2, 5
	4	2, 3, 6
	5	3, 4, 7
	6	4, 1, 8
TRIANGLE	1	1, 2, 4
	2	2, 3, 5
	3	3, 1, 6
TETRA	1	1, 2, 4, 5, 9, 8
	2	2, 3, 4, 6, 10, 9
	3	1, 4, 3, 8, 10, 7
	4	1, 3, 2, 7, 6, 5
WEDGE	1	1, 2, 5, 4, 7, 11, 13, 10
	2	2, 3, 6, 5, 8, 12, 14, 11
	3	1, 4, 6, 3, 10, 15, 12, 9
	4	1, 3, 2, 9, 8, 7
	5	4, 5, 6, 13, 14, 15
HEX	1	1, 2, 6, 5, 9, 14, 17, 13 , 26
	2	2, 3, 7, 6, 10, 15, 18, 14 , 25
	3	3, 4, 8, 7, 11, 16, 19, 15 , 27
	4	1, 5, 8, 4, 13, 20, 16, 12 , 24
	5	1, 4, 3, 2, 12, 11, 10, 9 , 22
	6	5, 6, 7, 8, 17, 18, 19, 20 , 23
PYRAMID	1	1, 2, 5, 6, 11, 10
	2	2, 3, 5, 7, 12, 11
	3	3, 4, 5, 8, 12, 12
	4	1, 5, 4, 10, 13, 9
	5	1, 4, 3, 2, 9, 8, 7, 6

3.

4.11.5 Side Set Node Count List

API functions: `ex_get_side_set_node_list; EXGSSN`

The length of the side set node count list is the length of the side set element list. For each entry in the side set element list, there is an entry in the side set side list, designating a local side number. The corresponding entry in the side set node count list is the number of nodes which define the particular side. In conjunction with the side set node list, this node count array provides an unambiguous nodal description of the side set.

4.11.6 Side Set Distribution Factors

API functions: `ex_put_side_set_dist_fact, ex_get_side_set_dist_fact;`
`EXPSSD, EXGSSD`

This is an optional list of floating point factors associated with the nodes on a side set. These data may be used for uneven application of load or boundary conditions. Because distribution factors are assigned at the nodes, application codes that utilize these factors must read the side set node list. The distribution factors must be stored/accessed in the same order as the nodes in the side set node list; thus, the ordering conventions described above apply.

4.12 Concatenated Side Sets

API functions: `ex_put_concat_side_sets, ex_get_concat_side_sets; EXPCSS,`
`EXGCSS`

Concatenated side sets provide a means of writing / reading all side sets with one function call. This is more efficient because it avoids some I/O overhead, particularly when considering the intricacies of the netCDF library. This is accomplished with the following lists:

- Side sets IDs -- list (of length number of side sets) of unique integer side set ID's. The *i*th entry in this list specifies the ID of the *i*th side set.
- Side sets side counts -- list (of length number of side sets) of counts of sides for each side set. Thus, the *i*th entry in this list specifies the number of sides in the *i*th side set. This also defines the number of elements in each side set.
- Side sets distribution factors counts -- list (of length number of side sets) of counts of distribution factors for each side set. The *i*th entry in this list specifies the number of distribution factors in the *i*th side set.
- Side sets side pointers -- list (of length number of side sets) of indices which are pointers into the side sets element list (and side list) locating the first element (or side) of each side set. The *i*th entry in this list is an index in the side sets element list (and side list) where the first element (or side) of the *i*th side set can be located.
- Side sets distribution factors pointers -- list (of length number of side sets) of indices which are pointers into the side sets distribution factors list locating the first

factor of each side set. The *i*th entry in this list is an index in the side sets distribution factors list where the first factor of the *i*th side set can be located.

- Side sets element list -- concatenated integer list of the elements in all the side sets. Internal element IDs (see Node Number Map) must be used in this list. The side sets side pointers and side sets side counts are used to find the first element and the number of elements in a particular side set.
- Side sets side list -- concatenated integer list of the sides in all the side sets. The side sets side pointers and side sets side counts are used to find the first side and the number of sides in a particular side set.
- Side sets distribution factors list -- concatenated list of the (floating point) distribution factors in all the side sets. The side sets distribution factors pointers and side sets distribution factors counts are used to find the first factor and the number of factors in a particular side set.

4.13 Object Names

API functions: `ex_put_names, ex_get_names, ex_put_name, ex_get_name`

Certain EXODUS II objects (currently element blocks, node sets, side sets, node maps, and element maps) can be given names. Each name is a unique label of length MAX_STR_LENGTH (MXSTLN in Fortran). The names are not used internally by the database, but can be used to provide a more meaningful name than the object ids.

4.14 Object Properties

Certain EXODUS II objects (currently element blocks, node sets, side sets, node maps, and element maps) can be given integer properties, providing the following capabilities:

1. assign a specific integer value to a named property of an object.
2. tag objects as members of a group. For example element blocks 1 and 3 and side sets 1 and 2 could be put in a group named "TOP."

This functionality is illustrated in **Error! Reference source not found.** which contains the property values of a sample EXODUS II file with three element blocks, one node set, and two side sets. Note that an application code can define properties to be valid for only specified object types. In this example, "STEEL" and "COPPER" are valid for all element blocks but are not defined for node sets and side sets.

Table 3 Example Property Table

Name	EB 1	EB 2	EB 3	NS 1	SS 1	SS 2
------	------	------	------	------	------	------

ID	10	20	30	100	200	201
TOP	1	0	1	0	1	1
LEFT	1	1	0	1	1	0
STEEL	0	0	1	NULL	NULL	NULL
COPPER	1	1	0	NULL	NULL	NULL

Interpretation of the integer values of the properties is left to the application codes, but in general, a nonzero positive value means the object has the named property (or is in the named group); a zero means the object does not have the named property (or is not in the named group). Thus, element block 1 has an ID of 10 (1 is a counter internal to the data base; an application code accesses the element block using the ID), node set 1 has an ID of 100, etc. The group “TOP” includes element block 1, element block 3, and side sets 1 and 2.

4.14.1 Property Parameters

API functions: `ex_put_prop_names, ex_get_prop_names; EXPPN, EXGPN`

The parameters include the number of properties and the names of length `MAX_STR_LENGTH` (`MXSTLN` in Fortran) for each property for each object type (i.e., element blocks, node sets, or side sets). In the preceding example, there are five properties for element blocks (i.e., “ID”, “TOP”, “LEFT”, “STEEL”, and “COPPER”), three properties for node sets (i.e., “ID”, “TOP”, and “LEFT”), and three properties for side sets (i.e., “ID”, “TOP”, and “LEFT”).

4.14.2 Property Values

API functions: `ex_put_prop, ex_get_prop, ex_put_prop_array,`
`ex_get_prop_array, ex_get_num_props; EXPP, EXGP, EXPPA, EXGPA`

Valid values for the properties are positive integers and zero. Property values are stored in arrays in the data file but can be written / read individually given an object type (i.e., element block, node set, or side set), object ID, and property name or as an array given an object type and property name. If accessed as an array, the order of the values in the array must correspond to the order in which the element blocks, node sets, or side sets were introduced into the file. For instance, if the parameters for element block with ID 20 were written to a file, and then parameters for element block with ID 10, followed by the parameters for element block with ID 30, the first, second, and third elements in the property array would correspond to element block 20, element block 10, and element block 30, respectively. This order can be determined with a call to `ex_get_elem_blk_ids` (`EXGEBI` for Fortran) which returns an array of element block IDs in the order that the corresponding element blocks were introduced to the data file.

4.15 Results Parameters

API functions: `ex_put_var_param, ex_get_var_param; EXPVP, EXGVP`

The number of each type of results variables (element, nodal, nodeset, sideset, and global) is specified only once, and cannot change through time.

4.15.1 Results Names

API functions: `ex_put_var_names, ex_get_var_names, ex_put_var_name, ex_get_var_name; EXPVAN, EXGVAN`

Associated with each results variable is a unique name of length `MAX_STR_LENGTH` (`MXSTLN` in Fortran).

4.16 Results Data

An integer output time step number (beginning with 1) is used as an index into the results variables written to or read from an EXODUS II file. It is a counter of the number of “data planes” that have been written to the file. The maximum time step number (i.e., the number of time steps that have been written) is available via a call to the database inquire function (Inquire EXODUS Parameters). For each output time step, the following information is stored.

4.16.1 Time Values

API functions: `ex_put_time, ex_get_time, ex_get_all_times; EXPTIM, EXGTIM, EXGATM`

A floating point value must be stored for each time step to identify the “data plane.” Typically, this is the analysis time but can be any floating point variable that distinguishes the time steps. For instance, for a modal analysis, the natural frequency for each mode may be stored as a “time value” to discriminate the different sets of eigenvectors. The only restriction on the time values is that they must monotonically increase.

4.16.2 Global Results

API functions: `ex_put_glob_vars, ex_get_glob_vars, ex_get_glob_var_time; EXPGV, EXGGV, EXGGVT`

This object contains the floating point global data for the time step. The length of the array is the number of global variables, as specified in the results parameters.

4.16.3 Nodal Results

API functions: `ex_put_nodal_var, ex_get_nodal_var, ex_get_nodal_var_time;`

This object contains the floating point nodal data for the time step. The size of the array is the number of nodes, as specified in the global parameters, times the number of nodal variables.

4.16.4 Element Results

API functions: `ex_put_elem_var`, `ex_get_elem_var`, `ex_get_elem_var_time`;
`EXPEV`, `EXGEV`, `EXGEVT`

Element variables are output for a given element block and a given element variable. Thus, at each time step, up to m element variable objects (where m is the product of the number of element blocks and the number of element variables) may be stored. However, since not all element variables must be output for all element blocks (see Ele below), m is the *maximum* number of element variable objects. The actual number of objects stored is the number of unique combinations of element variable index and element block ID passed to `ex_put_elem_var` (`EXPEV` for Fortran) or the number of non-zero entries in the element variable truth table (if it is used). The length of each object is the number of elements in the given element block.

4.16.5 Nodeset Results

API functions: `ex_put_nset_var`, `ex_get_nset_var`; `EXPNSV`, `EXGNSV`

Nodeset variables are output for a given nodeset and a given nodeset variable. Thus, at each time step, up to m nodeset variable objects (where m is the product of the number of nodesets and the number of nodeset variables) may be stored. However, since not all nodeset variables must be output for all nodeset (see Ele below), m is the *maximum* number of nodeset variable objects. The actual number of objects stored is the number of unique combinations of nodeset variable index and nodeset ID passed to `ex_put_nset_var` (`EXPNSV` for Fortran) or the number of non-zero entries in the nodeset variable truth table (if it is used). The length of each object is the number of nodes in the given nodeset.

4.16.6 Sideset Results

API functions: `ex_put_sset_var`, `ex_get_sset_var`; `EXPSSV`, `EXGSSV`

Sideset variables are output for a given sideset and a given sideset variable. Thus, at each time step, up to m sideset variable objects (where m is the product of the number of sidesets and the number of sideset variables) may be stored. However, since not all sideset variables must be output for all sideset (see Ele below), m is the *maximum* number of sideset variable objects. The actual number of objects stored is the number of unique combinations of sideset variable index and sideset ID passed to `ex_put_sset_var` (`EXPSSV` for Fortran) or the number of non-zero entries in the sideset variable truth table (if it is used). The length of each object is the number of sides (faces or edges) in the given sideset.

4.17 Element, Nodeset, Sideset Variable Truth Table

API functions: `ex_put_elem_var_tab, ex_get_elem_var_tab;`
 `ex_put_nset_var_tab, ex_get_nset_var_tab,`
 `ex_put_sset_var_tab, ex_get_sset_var_tab, ex_put_var_tab,`
 `ex_get_var_tab, EXPVTT, EXGVTT, EXPNSTT, EXGNSTT, EXPSSTT,`
 `EXGSST`

Because some element, nodeset, or sideset variables are not applicable (and thus not computed by a simulation code) for all types, the variable truth table is an optional mechanism for specifying whether a particular variable result is output for the entities in a particular element block, nodeset, or sideset. For example, hydrostatic stress may be an output result for the elements in element block 3, but not those in element block 6; or the contact normal force may be an output result for the faces in sideset 32, but not those in sideset 42.

It is helpful to describe the truth table as a two dimensional array, as shown in **Error! Reference source not found.** Each row of the array is associated with an element variable; each column of the array is associated with an element block. If a datum in the truth table is zero (`table(i,j)=0`), then no results are output for the *i*th element variable for the *j*th element block. A nonzero entry indicates that the appropriate result will be output. In this example, element variable 1 will be stored for all element blocks; element variable 2 will be stored for element blocks 1 and 4; and element variable 3 will be stored for element blocks 3 and 4. The table is stored such that the variable index cycles faster than the block index.

Table 4 Element Variable Truth Table

	Elem Block #1	Elem Block #2	Elem Block #3	Elem Block #4
Elem Var #1	1	1	1	1
Elem Var #2	1	0	0	1

The nodeset and sideset variable truth tables are similar.

4.18 Coordinate frames

API functions: `ex_put_coordinate_frames`
 `ex_get_coordinate_frames`

Coordinate frames may be stored in the database for access by applications. Each coordinate frame is tagged by an associated integer identifier, and is part of the geometry definition. Coordinate systems are defined by an origin and two orientation vectors, and can be defined as rectangular, cylindrical or spherical.

While exodus provides a coordinate system definition, it does not explicitly use these systems. For example, exodus cannot define nodal locations in terms of any but the default coordinate system.

Figure 6 Sample Coordinate Frame transformation.

5 Application Programming Interface (API)

EXODUS II files can be written and read by application codes written in C, C++, or Fortran via calls to functions in the application programming interface (API). Functions within the API are categorized as data file utilities, model description functions, or results data functions.

In general, the following pattern is followed for writing data objects to a file:

1. create the file with `ex_create` (or `EXCRE` for Fortran);
2. write out global parameters to the file using `ex_put_init` (or `EXPINI` for Fortran);
3. write out specific data object parameters; for example, put out element block parameters with `ex_put_elem_block` (or `EXPELB` for Fortran);
4. write out the data object; for example, put out the connectivity for an element block with `ex_put_elem_conn` (or `EXPELC` for Fortran);
5. close the file with `ex_close` (or `EXCLOS` for Fortran).

Steps 3 and 4 are repeated within this pattern for each data object (i.e., nodal coordinates, element blocks, node sets, side sets, results variables, etc.). For some data object types, steps 3 and 4 are combined in a single call. For instance, `ex_put_qa` (or `EXPQA` for Fortran) writes out the parameters (number of QA records) as well as the data object itself (the QA records). During the database writing process, there are a few order dependencies (e.g., an element block must be written before element variables for that element block are written) which are documented in the description of each library function.

The invocation of the EXODUS II API functions for reading data is order independent, providing random read access. The following steps are typically used for reading data:

1. open the file with `ex_open` (or `EXOPEN` for Fortran);
2. read the global parameters for dimensioning purposes with `ex_get_init` (or `EXGINI` for Fortran);
3. read specific data object parameters; for example, read node set parameters with `ex_get_node_set_param` (or `EXGNSP` for Fortran);
4. read the data object; for example, read the node set node list with `ex_get_node_set` (or `EXGNS` for Fortran);
5. close the file with `ex_close` (or `EXCLOS` for Fortran).

Again, steps 3 and 4 are repeated for each object. For some object parameters, step 3 may be accomplished with a call to `ex_inquire` (or `EXINQ` for Fortran) to inquire the size of certain objects.

In developing applications using the EXODUS II API, the following points may prove beneficial:

- All functions that write objects to the database begin with `ex_put_` (`EXP` for Fortran); functions that read objects from the database begin with `ex_get_` (`EXG` for Fortran).
- Function arguments are classified as readable (R), writable (W), or both (RW). Readable arguments are not modified by the API routines; writable arguments are modified; read-write arguments may be either depending on the value of the argument.
- All application codes which use the EXODUS II API must include the file 'exodusII.h' for C or 'exodusII.inc' for Fortran. These files define constants that are used (1) as arguments to the API routines, (2) to set global parameters such as maximum string length and database version, and (3) as error condition or function return values.
- Throughout this section, sample code segments have been included to aid the application developer in using the API routines. These segments are not complete and there has been no attempt to include all calling sequence dependencies within them. Additionally, most arrays in the Fortran coding examples are shown dimensioned to some maximum value (i.e., `MAXQA`, `MAXINF`, `MAXNOD`, etc.). These values are not predefined constants so the library routines cannot check actual numbers of records against them. They are shown in this document simply to give an indication of how to statically dimension the arrays if necessary.
- Because 2-dimensional arrays cannot be statically dimensioned, either dynamic dimensioning or user indexing is required. Most of the sample code segments utilize user indexing within 1-dimensional arrays even though the variables are logically 2-dimensional.
- There are many netCDF utilities that prove useful. `ncdump`, which converts a binary netCDF file to a readable ASCII file, is the most notable.
- Because netCDF buffers I/O, it is important to flush all buffers (with `ex_update` in C or `EXUPDA` in Fortran) when debugging an application that produces an EXODUS II file.

5.1 Data File Utilities

This section describes data file utility functions for creating / opening a file, initializing a file with global parameters, reading / writing information text, inquiring on parameters stored in the data file, and error reporting.

5.1.1 Create EXODUS II File

The function `ex_create` or (`EXCRE` for Fortran) creates a new EXODUS II file and returns an ID that can subsequently be used to refer to the file.

All floating point values in an EXODUS II file are stored as either 4-byte (“float” in C; “REAL*4” in FORTRAN) or 8-byte (“double” in C; “REAL*8” or “DOUBLE PRECISION” in FORTRAN) numbers; no mixing of 4- and 8-byte numbers in a single file is allowed. An application code can compute either 4- or 8-byte values and can designate that the values be stored in the EXODUS II file as either 4- or 8-byte numbers; conversion between the 4- and 8-byte values is performed automatically by the API routines. Thus, there are four possible combinations of compute word size and storage (or I/O) word size.

In case of an error, `ex_create` returns a negative number; `EXCRE` returns a nonzero error number in `IERR`. Possible causes of errors include:

- Passing a file name that includes a directory that does not exist.
- Specifying a file name of a file that exists and also specifying a no clobber option.
- Attempting to create a file in a directory without permission to create files there.
- Passing an invalid file mode.

ex_create: C Interface

```
int ex_create (path, cmode, comp_ws, io_ws);
```

`char* path (R)`

The file name of the new EXODUS II file. This can be given as either an absolute path name (from the root of the file system) or a relative path name (from the current directory).

`int cmode (R)`

Mode. Use one of the following predefined constants:

- | | |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| • <code>EX_NOCLOBBER</code> | •To create the new file only if the given file name does not refer to a file that already exists. |
| • <code>EX_CLOBBER</code> | •To create the new file, regardless of whether a file with the same name already exists. If a file with the same name does exist, its contents will be erased. |
| • <code>EX_LARGE_MODEL</code> | •To create a model that can store individual datasets larger than 2 gigabytes. This modifies the internal storage used by <code>exodusII</code> and also puts the underlying <code>netcdf</code> file into the “64-bit offset” mode. See Appendix E for more details on this mode. ¹ |
| • <code>EX_NORMAL_MODEL</code> | •Create a standard model. |
| • <code>EX_NETCDF4</code> | •To create a model using the HDF5-based |

¹A “large model” file will also be created if the environment variable “`EXODUS_LARGE_MODEL`” is defined in the users environment. A message will be printed to standard output if this environment variable is found.

netcdf-4 output. (Future capability)²

- `EX_NOSHARE` Do not open the underlying netCDF file in “share” mode. See the netCDF documentation for more details.

`int* comp_ws (RW)`

The word size in bytes (0, 4 or 8) of the floating point variables used in the application program. If 0 (zero) is passed, the default `sizeof(float)` will be used and returned in this variable. **WARNING:** all EXODUS II functions requiring floats must be passed floats declared with this passed in or returned compute word size (4 or 8).

`int* io_ws (R)`

The word size in bytes (4 or 8) of the floating point data as they are to be stored in the EXODUS II file.

The following code segment creates an EXODUS II file called `test.exe`:

```
#include "exodusII.h"
int CPU_word_size, IO_word_size, exoid;
CPU_word_size = sizeof(float);          /* use float or double */
/*
IO_word_size = 8;                       /* store variables as
doubles */
/* create EXODUS II file */
exoid = ex_create ("test.exe",           /* filename path */
                  EX_CLOBBER,            /* create mode */
                  &CPU_word_size,       /* CPU float word size in bytes */
                  &IO_word_size);       /* I/O float word size in bytes */
```

EXCRE: Fortran Interface

INTEGER FUNCTION EXCRE (PATH, ICMODE, ICOMPWS, IOWS, IERR)

CHARACTER*(*) PATH (R)

The file name of the new EXODUS II file. This can be given as either an absolute path name (from the root of the file system) or a relative path name (from the current directory).

INTEGER ICMODE (R)

Clobber mode. Use one of the following predefined constants:

- `EXNOCL` • To create the new file only if the given file name does not refer to a file that already exists.
- `EXCLOB` • To create the new file, regardless of whether a file with the same name already exists. If a file with the same name does exist, its contents will be

²NetCDF-4 is currently in alpha mode; however, it will be used for ExodusII when available, so this mode is being defined here for future completeness. An HDF5-based netcdf-4 file will also be created if the environment variable “EXODUS_NETCDF4” is defined in the users environment. A message will be printed to standard output if this environment variable is found.

- EXNORM •Create a normal (32-bit offset) model.
- EXLARG •To create a model which can store individual datasets larger than 2 gigabytes. This modifies the internal storage used by exodusII and also puts the underlying netcdf file into the “64-bit offset” mode. See Appendix E for more details on this mode.³
- EXNET4 •To create a model using the HDF5-based netcdf-4 output. (Future capability)⁴
- EXNOSH •Do not open the underlying netCDF file in “share” mode. See the netCDF documentation for more details.

The word size in bytes (0, 4 or 8) of the floating point (REAL) variables used in the application program. If 0 (zero) is passed, the default size of floating point values for the machine will be used and returned in this variable. WARNING: all EXODUS II functions requiring reals must be passed reals declared with this passed in or returned compute word size (4 or 8).

The word size in bytes (4 or 8) of the floating point (REAL) data as they are to be stored in the EXODUS II file.

Returned error code. If no errors occurred, 0 is returned.

```

    include 'exodusII.inc'
    integer cpu_ws, io_ws
c create EXODUS II files;
c REAL variables are default reals; store in file as DOUBLE PRECISION
    cpu_ws = 0
    io_ws = 8
    idexo = excre ('test.exo', EXCLOB, cpu_ws, io_ws, ierr)

```

The function `ex_open` or (`EXOPEN` for Fortran) opens an existing EXODUS II file and returns an ID that can subsequently be used to refer to the file, the word size of the floating point values stored in the file, and the version of the EXODUS II database (returned as a “float” in C or “REAL” in Fortran, regardless of the compute or I/O word size). Multiple files may be “open” simultaneously.

⁴NetCDF-4 is currently in alpha mode; however, it will be used for ExodusII when available, so this mode is being defined here for future completeness. An HDF5-based netcdf-4 file will also be created if the environment variable “EXODUS_NETCDF4” is defined in the users environment. A message will be printed to standard output if this environment variable is found.

In case of an error, `ex_open` returns a negative number; `EXOPEN` returns a nonzero error number in `IERR`. Possible causes of errors include:

- The specified file does not exist.
- The mode specified is something other than the predefined constant `EX_READ` (`EXREAD` for Fortran) or `EX_WRITE` (`EXWRITE` for Fortran).
- Database version is earlier than 2.0.

ex_open: C Interface

```
int ex_open (path, mode, comp_ws, io_ws, version);
```

`char* path (R)`

The file name of the EXODUS II file. This can be given as either an absolute path name (from the root of the file system) or a relative path name (from the current directory).

`int mode (R)`

Access mode. Use one of the following predefined constants:

- `EX_READ` To open the file just for reading.
- `EX_WRITE` To open the file for writing and reading.

`int* comp_ws (RW)`

The word size in bytes (0, 4 or 8) of the floating point variables used in the application program. If 0 (zero) is passed, the default size of floating point values for the machine will be used and returned in this variable. WARNING: all EXODUS II functions requiring reals must be passed reals declared with this passed in or returned compute word size (4 or 8).

`int* io_ws (RW)`

The word size in bytes (0, 4 or 8) of the floating point data as they are stored in the EXODUS II file. If the word size does not match the word size of data stored in the file, a fatal error is returned. If this argument is 0, the word size of the floating point data already stored in the file is returned.

`float* version (W)`

Returned EXODUS II database version number. The current version is 2.02

The following opens an EXODUS II file named `test.exo` for read only, using default settings for compute and I/O word sizes:

```
#include "exodusII.h"
int CPU_word_size, IO_word_size, exoid;
float version;
CPU_word_size = sizeof(float);          /* float or double */
IO_word_size = 0;                       /* use what is stored
in file */

/* open EXODUS II files */
exoid = ex_open ("test.exo",             /* filename path */
                EX_READ,                  /* access mode = READ */
                &CPU_word_size,           /* CPU word size */
                &IO_word_size,           /* IO word size */
                &version);
```

```
&version); /* ExodusII library version */
```

If the EXODUS II database was created in the “Large Model” format, it will automatically be detected when opened with no user intervention required.

EXOPEN: Fortran Interface

```
INTEGER FUNCTION EXOPEN (PATH, IMODE, ICOMPWS, IOWS, VERS, IERR)
```

```
CHARACTER*(*) PATH (R)
```

The file name of the EXODUS II file. This can be given as either an absolute path name (from the root of the file system) or a relative path name (from the current directory).

```
INTEGER IMODE (R)
```

Access mode. Use one of the following predefined constants:

- `EXREAD` To open the file just for reading.
- `EXWRIT` To open the file for writing and reading.

```
INTEGER ICOMPWS (RW)
```

The word size in bytes (0, 4 or 8) of the floating point variables used in the application program. If 0 (zero) is passed, the default size of floating point values for the machine will be used and returned in this variable. **WARNING:** all EXODUS II functions requiring reals must be passed reals declared with this passed in or returned compute word size.

```
INTEGER IOWS (RW)
```

The word size in bytes (0, 4 or 8) of the floating point data as they are stored in the EXODUS II file. If the word size does not match the word size of data stored in the file, a fatal error is returned. If this argument is 0, the word size of the floating point data already stored in the file is returned.

```
REAL VERS (W)
```

Returned EXODUS II version number. The current version is 2.02

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

The following opens an EXODUS II file named `test.exo` for read only, using default settings for compute and I/O word sizes:

```
include 'exodusII.inc'
integer cpu_ws, io_ws
real vers
c
c open EXODUS II file
cpu_ws = 0
io_ws = 0
idexo = exopen ('test.exo', EXREAD, cpu_ws, io_ws, vers, ierr)
```

If the EXODUS II database was created in the “Large Model” format, it will automatically be detected when opened with no user intervention required.

5.1.3 Close EXODUS II File

The function `ex_close` or (`EXCLOS` for Fortran) updates and then closes an open EXODUS II file.

In case of an error, `ex_close` returns a negative number; a warning will return a positive number. `EXCLOS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).

ex_close: C Interface

```
int ex_close (exoid);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

The following code segment closes an open EXODUS II file:

```
int error, exoid;  
error = ex_close (exoid);
```

EXCLOS: Fortran Interface

```
SUBROUTINE EXCLOS ( IDEXO, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

The following code segment closes an open EXODUS II file:

```
call exclos (idexo, ierr)
```

5.1.4 Update EXODUS II File

The function `ex_update` or (`EXUPDA` for Fortran) flushes all buffers to an EXODUS II file that is open for writing. This routine insures that the EXODUS II file is current.

In case of an error, `ex_update` returns a negative number; a warning will return a positive number. `EXUPDA` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).

ex_update: C Interface

```
int ex_update (exoid);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

The following code segment flushes all buffers to an open EXODUS II file:

```
int error,exoid;  
error = ex_update (exoid);
```

EXUPDA: Fortran Interface

```
SUBROUTINE EXUPDA ( IDEXO, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code segment flushes all buffers to an open EXODUS II file:

```
c  
c update the data file; this should be done at the end of every  
c time step to ensure that no data is lost if the analysis dies  
c  
call exupda (idexo, ierr)
```

5.1.5 Write Initialization Parameters

The function `ex_put_init` (`EXPINI` in Fortran) writes the initialization parameters to the EXODUS II file. This function must be called once (and only once) before writing any data to the file.

In case of an error, `ex_put_init` returns a negative number; a warning will return a positive number. `EXPINI` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- this routine has been called previously.

ex_put_init: C Interface

```
int ex_put_init (exoid, title, num_dim, num_nodes, num_elem, num_elem_blk,  
                num_node_sets, num_side_sets);
```

int exoid (R)

EXODUS file ID returned from a previous call to ex_create or ex_open.

char* title (R)

Database title. Maximum length is MAX_LINE_LENGTH.

int num_dim (R)

The dimensionality of the database. This is the number of coordinates per node.

int num_nodes (R)

The number of nodal points.

int num_elem (R)

The number of elements.

int num_elem_blk (R)

The number of element blocks.

int num_node_sets (R)

The number of node sets.

int num_side_sets (R)

The number of side sets.

The following code segment will initialize an open EXODUS II file with the specified parameters:

```
int num_dim, num_nods, num_el, num_el_blk, num_ns, num_ss, error, exoid;

/* initialize file with parameters */
num_dim = 3; num_nods = 46; num_el = 5; num_el_blk = 5;
num_ns = 2; num_ss = 5;
error = ex_put_init (exoid, "This is the title", num_dim,
    num_nods, num_el, num_el_blk, num_ns, num_ss);
```

EXPINI: Fortran Interface

SUBROUTINE EXPINI (IDEXO, TITLE, NDIM, NUMNP, NUMEL, NELBLK, NUMNPS, NUMESS,
IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

CHARACTER*MXLNLN TITLE (R)

Database title.

INTEGER NDIM (R)

The dimensionality of the database. This is the number of coordinates per node.

INTEGER NUMNP (R)

The number of nodal points.

INTEGER NUMEL (R)

The number of elements.

INTEGER NELBLK (R)

The number of element blocks.

INTEGER NUMNPS (R)

The number of node sets.

INTEGER NUMESS (R)

The number of side sets.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will initialize an open EXODUS II file with the specified parameters:

```
include 'exodusII.inc'
character*(MXLNLN) title
C
C initialize file with parameters
C
  title = "This is the title"
  num_dim = 2
  num_nodes = 8
  num_elem = 2
  num_elem_blk = 2
  num_node_sets = 2
  num_side_sets = 2

  call expini (idexo, title, num_dim, num_nodes, num_elem,
1 num_elem_blk, num_node_sets, num_side_sets, ierr)
```

5.1.6 Read Initialization Parameters

The function `ex_get_init` (EXGINI in Fortran) reads the initialization parameters from an opened EXODUS II file.

In case of an error, `ex_get_init` returns a negative number; a warning will return a positive number. EXGINI returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (EXCRE or EXOPEN for Fortran).

ex_get_init: C Interface

```
int ex_get_init (exoid, title, num_dim, num_nodes, num_elem, num_elem_blk,
  num_node_sets, num_side_sets);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* title (W)

Returned database title. String length may be up to `MAX_LINE_LENGTH` bytes.

int* num_dim (W)

Returned dimensionality of the database. This is the number of coordinates per node.

```
int* num_nodes (W)
    Returned number of nodal points.
int* num_elem (W)
    Returned number of elements.
int* num_elem_blk (W)
    Returned number of element blocks.
int* num_node_sets (W)
    Returned number of node sets.
int* num_side_sets (W)
    Returned number of side sets.
```

The following code segment will read the initialization parameters from the open EXODUS II file:

```
#include "exodusII.h"

int num_dim, num_nodes, num_elem, num_elem_blk,
    num_node_sets, num_side_sets, error, exoid;
char title[MAX_LINE_LENGTH+1];

/* read database parameters */
error = ex_get_init (exoid, title, &num_dim, &num_nodes,
    &num_elem, &num_elem_blk, &num_node_sets, &num_side_sets);
```

EXGINI: Fortran Interface

```
SUBROUTINE EXGINI (IDEXO, TITLE, NDIM, NUMNP, NUMEL, NELBLK, NUMNPS, NUMESS,
    IERR)
INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.
CHARACTER*MXLNLN TITLE (W)
    Returned database title.
INTEGER NDIM (W)
    Returned dimensionality of the database. This is the number of coordinates per node.
INTEGER NUMNP (W)
    Returned number of nodal points.
INTEGER NUMEL (W)
    Returned number of elements.
INTEGER NELBLK (W)
    Returned number of element blocks.
INTEGER NUMNPS (W)
    Returned number of node sets.
INTEGER NUMESS (W)
    Returned number of side sets.
```

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will read the initialization parameters from the open EXODUS II file:

```
character*(MXLNLN) titl
c
c read database parameters
c
call exgini (idexo, titl, num_dim, num_nodes, num_elem,
1 num_elem_blk, num_node_sets, num_side_sets, ierr)
```

5.1.7 Write QA Records

The function `ex_put_qa` (or `EXPQA` for Fortran) writes the QA records to the database. Each QA record contains four `MAX_STR_LENGTH`-byte character strings. The character strings are:

- 1) the analysis code name
- 2) the analysis code QA descriptor
- 3) the analysis date
- 4) the analysis time

In case of an error, `ex_put_qa` returns a negative number; a warning will return a positive number. `EXPQA` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- QA records already exist in file.

ex_put_qa: C Interface

```
int ex_put_qa (exoid, num_qa_records, qa_record[][4]);
int exoid (R)
    EXODUS file ID returned from a previous call to ex_create or ex_open.
int num_qa_records (R)
    The number of QA records.
char* qa_record (R)
    Array containing the QA records.
```

The following code segment will write out two QA records:

```
int num_qa_rec, error, exoid;
char *qa_record[2][4];

/* write QA records */
num_qa_rec = 2;
```

```

qa_record[0][0] = "TESTWT1";
qa_record[0][1] = "testwt1";
qa_record[0][2] = "20060214";
qa_record[0][3] = "15:41:33";
qa_record[1][0] = "FASTQ";
qa_record[1][1] = "fastq";
qa_record[1][2] = "20060215";
qa_record[1][3] = "16:41:33";

error = ex_put_qa (exoid, num_qa_rec, qa_record);

```

EXPQA: Fortran Interface

SUBROUTINE EXPQA (IDEXO, NQAREC, QAREC, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER NQAREC (R)

The number of QA records.

CHARACTER*MXSTLN QAREC (4,*) (R)

Array containing the QA records.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will write out two QA records:

```

c NOTE:      MAXQA is the maximum number of QA records
c
c   include 'exodusII.inc'
c   character*(MXSTLN) qa_record(4,MAXQA)
c
c write QA records
c
c
c   num_qa_rec = 2
c
c   qa_record(1,1) = "TESTWT2"
c   qa_record(2,1) = "testwt2"
c   qa_record(3,1) = "07/07/93"
c   qa_record(4,1) = "15:41:33"
c   qa_record(1,2) = "FASTQ"
c   qa_record(2,2) = "fastq"
c   qa_record(3,2) = "07/07/93"
c   qa_record(4,2) = "16:41:33"
c
c   call expqa (idexo, num_qa_rec, qa_record, ierr)

```

5.1.8 Read QA Records

The function `ex_get_qa` (or `EXGQA` for Fortran) reads the QA records from the database. Each QA record contains four `MAX_STR_LENGTH`-byte character strings. The character strings are:

- 1) the analysis code name
- 2) the analysis code QA descriptor
- 3) the analysis date
- 4) the analysis time

Memory must be allocated for the QA records before this call is made. The number of QA records can be determined by invoking `ex_inquire` (or `EXINQ` in Fortran). See Inquire EXODUS Parameters.

In case of an error, `ex_get_qa` returns a negative number; a warning will return a positive number. `EXGQA` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no QA records were stored.

ex_get_qa: C Interface

```
int ex_get_qa (exoid, qa_record[][4]);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* qa_record (W)
Returned array containing the QA records.

The following will determine the number of QA records and read them from the open EXODUS II file:

```
#include "exodusII.h"

int num_qa_rec, error, exoid
char *qa_record[MAX_QA_REC][4];

/* read QA records */

ex_inquire (exoid, EX_INQ_QA, &num_qa_rec, &fdum, cdum);

for (i=0; i<num_qa_rec; i++)
    for (j=0; j<4; j++)
        qa_record[i][j] =
            (char *) calloc ((MAX_STR_LENGTH+1), sizeof(char));

error = ex_get_qa (exoid, qa_record);
```

EXGQA: Fortran Interface

```
SUBROUTINE EXGQA (IDEXO, QAREC, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

```
CHARACTER*MXSTLN QAREC(4,*) (W)
```

Returned array containing the QA records.

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

The following will determine the number of QA records and read them from the open EXODUS II file:

```
C NOTE:                                MAXQA is the maximum number of QA
C      records
C
C      include 'exodusII.inc'
C      character*(MXSTLN) qa_record(4,MAXQA)
C
C read QA records
C
C      call exinq (idexo, EXQA, num_qa_rec, fdum, cdum, ierr)
C
C      call exgqa (idexo, qa_record, ierr)
```

5.1.9 Write Information Records

The function `ex_put_info` (or `EXPINF` for Fortran) writes information records to the database. The records are `MAX_LINE_LENGTH`-character strings.

In case of an error, `ex_put_info` returns a negative number; a warning will return a positive number. `EXPINF` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (EXCRE or EXOPEN for Fortran).
- data file opened for read only.
- information records already exist in file.

ex_put_info: C Interface

```
int ex_put_info (exoid, num_info, info);
```

```
int exoid (R)
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

```
int num_info (R)
```

The number of information records.

```
char** info (R)
```

Array containing the information records.

The following code will write out three information records to an open EXODUS II file:

```
int error, exoid, num_info;
char *info[3];

/* write information records */

num_info = 3;

info[0] = "This is the first information record.";
info[1] = "This is the second information record.";
info[2] = "This is the third information record.";

error = ex_put_info (exoid, num_info, info);
```

EXPINF: Fortran Interface

```
SUBROUTINE EXPINF (IDEXO, NINFO, INFO, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

```
INTEGER NINFO (R)
```

The number of information records.

```
CHARACTER*MXLNLN INFO(*) (R)
```

Array containing the information records.

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

The following code will write out three information records to an open EXODUS II file:

```
c NOTE:                                     MAXINF is the maximum number of
c   information records
c
c   include 'exodusII.inc'
c   character*(MXLNLN) inform(MAXINF)
c
c write information records
c
c
c   num_info = 3
c
c   inform(1) = "This is the first information record."
```

```

inform(2) = "This is the second information record."
inform(3) = "This is the third information record."

call expinf (idexo, num_info, inform, ierr)

```

5.1.10 Read Information Records

The function `ex_get_info` (or `EXGINF` for Fortran) reads information records from the database. The records are `MAX_LINE_LENGTH`-character strings. Memory must be allocated for the information records before this call is made. The number of records can be determined by invoking `ex_inquire` (or `EXINQ` in Fortran). See Inquire EXODUS Parameters.

In case of an error, `ex_get_info` returns a negative number; a warning will return a positive number. `EXGINF` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no information records were stored.

ex_get_info: C Interface

```

int ex_get_info (exoid, info);

```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char** info (W)
Returned array containing the information records.

The following code segment will determine the number of information records and read them from an open EXODUS II file:

```

#include "exodusII.h"

int error, exoid, num_info;
char *info[MAXINFO];

/* read information records */

error = ex_inquire (exoid, EX_INQ_INFO, &num_info, &fdum, cdum);

for (i=0; i<num_info; i++)
    info[i] = (char *) calloc ((MAX_LINE_LENGTH+1), sizeof(char));

error = ex_get_info (exoid, info);

```

EXGINF: Fortran Interface

```
SUBROUTINE EXGINF (IDEXO, INFO, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

```
CHARACTER*MXLNLN INFO(*) (W)
```

Returned array containing the information records.

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

The following code segment will determine the number of information records and read them from an open EXODUS II file:

```
c NOTE:                                MAXINF is the maximum number of
c   information records
c
c   include 'exodusII.inc'
c   character*(MXLNLN) inform(MAXINF)
c
c read information records
c
c   call exinq (idexo, EXINFO, num_info, fdum, cdum, ierr)
c
c   call exginf (idexo, inform, ierr)
```

5.1.11 Inquire EXODUS Parameters

The function `ex_inquire` (or `EXINQ` in Fortran) is used to inquire values of certain data entities in an EXODUS II file. Memory must be allocated for the returned values before this function is invoked.

In case of an error, `ex_inquire` returns a negative number; a warning will return a positive number. `EXINQ` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (EXCRE or EXOPEN for Fortran).
- requested information not stored in the file.
- invalid request flag.

ex_inquire: C Interface

```
int ex_inquire (exoid, req_info, ret_int, ret_float, ret_char);
```

```
int exoid (R)
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int req_info (R)`

A flag which designates what information is requested. It must be one of the following constants (predefined in the file `exodusII.h`):

- `EX_INQ_API_VERS` The EXODUS II API version number is returned in `ret_float`. The API version number reflects the release of the function library (i.e., function names, argument list, etc.).
- `EX_INQ_DB_VERS` The EXODUS II database version number is returned in `ret_float`. The database version number reflects the format of the data in the EXODUS II file.
- `EX_INQ_TITLE` The title stored in the database is returned in `ret_char`.
- `EX_INQ_DIM` The dimensionality, or number of coordinates per node (1, 2 or 3), of the database is returned in `ret_int`.
- `EX_INQ_NODES` The number of nodal points is returned in `ret_int`.
- `EX_INQ_ELEM` The number of elements is returned in `ret_int`.
- `EX_INQ_ELEM_BLK` The number of element blocks is returned in `ret_int`.
- `EX_INQ_NODE_SETS` The number of node sets is returned in `ret_int`.
- `EX_INQ_NS_NODE_LEN` The length of the concatenated node sets node list is returned in `ret_int`.
- `EX_INQ_NS_DF_LEN` The length of the concatenated node sets distribution list is returned in `ret_int`.
- `EX_INQ_SIDE_SETS` The number of side sets is returned in `ret_int`.
- `EX_INQ_SS_ELEM_LEN` The length of the concatenated side sets element list is returned in `ret_int`.
- `EX_INQ_SS_DF_LEN` The length of the concatenated side sets distribution factor list is returned in `ret_int`.
- `EX_INQ_SS_NODE_LEN` The aggregate length of all of the side sets node lists is returned in `ret_int`.
- `EX_INQ_EB_PROP` The number of integer properties stored for each element block is returned in `ret_int`; this number includes the property named "ID".
- `EX_INQ_NS_PROP` The number of integer properties stored for each node set is returned in `ret_int`; this number includes the property named "ID".
- `EX_INQ_SS_PROP` The number of integer properties stored for each side set is returned in `ret_int`; this number includes the property named "ID".
- `EX_INQ_QA` The number of QA records is returned in `ret_int`.

- EX_INQ_INFO The number of information records is returned in `ret_int`.
- EX_INQ_TIME The number of time steps stored in the database is returned in `ret_int`.

`int* ret_int (W)`

Returned integer, if an integer value is requested (according to `req_info`); otherwise, supply a dummy argument.

`float* ret_float (W)`

Returned float, if a float value is requested (according to `req_info`); otherwise, supply a dummy argument.

`char* ret_char (W)`

Returned single character, if a character value is requested (according to `req_info`); otherwise, supply a dummy argument.

As an example, the following will return the number of element block properties stored in the EXODUS II file:

```
#include "exodusII.h"
int error, exoid, num_props;
float fdum;
char *cdum;

/* determine the number of element block properties */

error = ex_inquire (exoid, EX_INQ_EB_PROP, &num_props, &fdum, cdum);
```

EXINQ: Fortran Interface

SUBROUTINE EXINQ (IDEXO, INFREQ, INTRET, RELRET, CHRRET, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER INFREQ (R)

A flag which designates what information is requested. It must be one of the following constants (predefined in the file `exodusII.inc`):

- EXAPVR •The EXODUS II API version number is returned in `RELRET`. The API version number reflects the release of the function library (i.e., function names, argument list, etc.).
- EXDBVR •The EXODUS II database version number is returned in `RELRET`. The database version number reflects the format of the data in the EXODUS II file.
- EXTITL •The title stored in the database is returned in `CHRRET`.
- EXDIM •The dimensionality, or number of coordinates per node (1, 2 or 3), of the database is returned in `INTRET`.
- EXNODE •The number of nodal points is returned in `INTRET`.

- EXELEM •The number of elements is returned in INTRET.
- EXVERS •The number of element blocks in returned in INTRET.
- EXNODS •The number of node sets is returned in INTRET.
- EXNSNL •The length of the concatenated node sets node list is returned in INTRET.
- EXNSDF •The length of the concatenated node sets distribution factors list is returned in INTRET.
- EXSIDS •The number of side sets is returned in INTRET.
- EXSSEL •The length of the concatenated side sets element list is returned in INTRET.
- EXSSDF •The length of the concatenated side sets distribution factors list is returned in INTRET.
- EXSSNL •The aggregate length of all of the side sets node lists is returned in INTRET.
- EXNEBP •The number of integer properties stored for each element block is returned in INTRET; this number includes the property named "ID".
- EXNNSP •The number of integer properties stored for each node set is returned in INTRET; this number includes the property named "ID".
- EXNSSP •The number of integer properties stored for each side set is returned in INTRET; this number includes the property named "ID".
- EXQA •The number of QA records is returned in INTRET.
- EXINFO •The number of information records is returned in INTRET.
- EXTIMS •The number of time steps stored in the database is returned in INTRET.

INTEGER INTRET (W)

Returned integer, if an integer value is requested (according to INFREQ); otherwise, supply a dummy argument.

REAL RELRET (W)

Returned float, if a float value is requested (according to INFREQ); otherwise, supply a dummy argument.

CHARACTER*(*) CHRRET (W)

Returned single character, if a character value is requested (according to INFREQ); otherwise, supply a dummy argument.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

As an example, the following will return the number of element block properties stored in the EXODUS II file:

```
include 'exodusII.inc'

real fdum
character*1 cdum
c
c read element block properties
c
```

```
call exinq (idexo, EXNEBP, num_props, fdum, cdum, ierr)
```

5.1.12 Error Reporting

The function `ex_err` or (`EXERR` for Fortran) logs an error to `stderr`. It is intended to provide explanatory messages for error codes returned from other EXODUS II routines. This function does not return an error code.

The passed in error codes and corresponding messages are listed in Appendix C. The programmer may supplement the error message printed for standard errors by providing an error message. If the error code is provided with no error message, the predefined message will be used. The error code `EX_MSG` is available to log application specific messages.

ex_err: C Interface

```
void ex_err (module_name, message, err_num);
```

`char* module_name (R)`

This is a string containing the name of the calling function.

`char* message (R)`

This is a string containing a message explaining the error or problem. If `EX_VERBOSE` (see `ex_opts`) is true, this message will be printed to `stderr`. Otherwise, nothing will be printed.

`int err_num (R)`

This is an integer code identifying the error. EXODUS II C functions place an error code value in `exerrval`, an external `int`. Negative values are considered fatal errors while positive values are warnings. There is a set of predefined values defined in `exodusII.h`. The predefined constant `EX_PRTLASTMSG` will cause the last error message to be output, regardless of the setting of the error reporting level (see `ex_opts`).

The following is an example of the use of this function:

```
#include "exodusII.h"
int exoid, CPU_word_size, IO_word_size, errval;
float version;
char errmsg[MAX_ERR_LENGTH];

CPU_word_size = sizeof(float);
IO_word_size = 0;

/* open EXODUS II file */

if (exoid = ex_open ("test.exo", EX_READ, &CPU_word_size, &IO_word_size,
    &version))
{
    errval = 999;
    sprintf(errmsg, "Error: cannot open file test.exo");
    ex_err("prog_name", errmsg, errval);
}
```

EXERR: Fortran Interface

```
SUBROUTINE EXERR (MODNAM, MSG, ERRNUM)
```

```
CHARACTER*MXSTLN MODNAM (R)
```

This is a string containing the name of the calling function.

```
CHARACTER*MXLNLN MSG (R)
```

This is a string containing a message explaining the error or problem. If EXVRBS (see EXOPTS) is true, this message will be printed to `stderr`. Otherwise, nothing will be printed.

```
INTEGER ERRNUM (R)
```

This is an integer code identifying the error. EXODUS II Fortran functions place an error code value in `ierr`, a returned value. Negative values are considered fatal errors while positive values are warnings. There is a set of predefined values defined in `exodusII.inc`. The predefined constant `PRTMSG` will cause the last error message to be output, regardless of the setting of the error reporting level (see EXOPTS)

The following is an example of the use of this function:

```
include 'exodusII.inc'

integer cpu_ws
c
c open EXODUS II files
c

cpu_ws = 0
io_ws = 0

idexo = exopen ("test.exo", EXREAD, cpu_ws, io_ws, vers, ierr)

if (ierr .lt. 0) then
c
c   error was fatal, so print it out; override setting of exopts
c
  call exerr ("programe", "", PRTMSG)
endif
```

5.1.13 Set Error Reporting Level

The function `ex_opts` (or EXOPTS for Fortran) is used to set message reporting options.

In case of an error, `ex_opts` returns a negative number; a warning will return a positive number. EXOPTS returns a nonzero error (negative) or warning (positive) number in `IERR`.

ex_opts: C Interface

```
int ex_opts (option_val);
```

int option_val (R)

Integer option value. Current options are:

- EX_ABORT •Causes fatal errors to force program exit. (Default is false.)
- EX_DEBUG •Causes certain messages to print for debug use. (Default is false.)
- EX_VERBOSE •Causes all error messages to print when true, otherwise no error messages will print. (Default is false.).

NOTE: Values may be OR'ed together to provide any combination of these capabilities.

For example, the following will cause all messages to print and will cause the program to exit upon receipt of fatal error:

```
#include "exodusII.h"
ex_opts (EX_ABORT | EX_VERBOSE);
```

EXOPTS: Fortran Interface

SUBROUTINE EXOPTS (OPTVAL, IERR)

INTEGER OPTVAL (R)

Integer option value. Current options are:

- EXABRT •Causes fatal errors to force program exit. (Default is false.)
- EXDEBG •Causes certain messages to print for debug use. (Default is false.)
- EXVRBS •Causes all error messages to print when true, otherwise no error messages will print. (Default is false.)

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

NOTE: Values may be OR'ed together to provide any combination of capabilities.

For example, the following will cause all messages to print:

```
include 'exodusII.inc'
call exopts (EXVRBS, IERR)
```

5.1.14 Determine if File is Large or Normal Format

The function `ex_large_model` is used to determine whether the EXODUS II file is being written in "large model" format or in the normal format. This information is not typically needed if the user is using the API for all file accesses, but may be useful if the user is also directly accessing the underlying data file using the netCDF API.

5.2 Model Description

The routines in this section read and write information which describe an EXODUS II finite element model. This includes nodal coordinates, element order map, element connectivity arrays, element attributes, node sets, side sets, coordinate frames, and object properties.

5.2.1 Write Nodal Coordinates

The function `ex_put_coord` (or `EXPCOR` for Fortran) writes the coordinates of the nodes in the model. The function `ex_put_init` (`EXPINI` for Fortran) must be invoked before this call is made.

Because the coordinates are floating point values, the application code must declare the arrays passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_coord` returns a negative number; a warning will return a positive number. `EXPCOR` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).

ex_put_coord: C Interface

```
int ex_put_coord (exoid, x_coord, y_coord, z_coord);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

void* x_coord (R)

The X coordinates of the nodes. If this is NULL, the X coordinates will not be written in this call.

void* y_coord (R)

The Y coordinates of the nodes. These are stored only if `num_dim > 1`; otherwise, pass in dummy address. If this is NULL, the Y coordinates will not be written in this call.

void* z_coord (R)

The Z coordinates of the nodes. These are stored only if `num_dim > 2`; otherwise, pass in dummy address. If this is NULL, the Z coordinates will not be written in this call.

The following will write the nodal coordinates to an open EXODUS II file:

```
int error, exoid;
```

```

/* if file opened with compute word size of sizeof(float) */
float x[8], y[8], z[8];

/* write nodal coordinates values to database */

x[0] = 0.0; y[0] = 0.0; z[0] = 0.0;
x[1] = 0.0; y[1] = 0.0; z[1] = 1.0;
x[2] = 1.0; y[2] = 0.0; z[2] = 1.0;
x[3] = 1.0; y[3] = 0.0; z[3] = 0.0;
x[4] = 0.0; y[4] = 1.0; z[4] = 0.0;
x[5] = 0.0; y[5] = 1.0; z[5] = 1.0;
x[6] = 1.0; y[6] = 1.0; z[6] = 1.0;
x[7] = 1.0; y[7] = 1.0; z[7] = 0.0;

error = ex_put_coord (exoid, x, y, z);

/* Do the same as the above in three separate calls... */
error = ex_put_coord (exoid, x, NULL, NULL);
error = ex_put_coord (exoid, NULL, y, NULL);
error = ex_put_coord (exoid, NULL, NULL, z);

```

EXPCOR: Fortran Interface

```

SUBROUTINE EXPCOR (IDEXO, XN, YN, ZN, IERR)

```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

REAL XN(*) (R)
The X coordinates of the nodes.

REAL YN(*) (R)
The Y coordinates of the nodes. These are stored only if `NDIM > 1`; otherwise, pass in a dummy address.

REAL ZN(*) (R)
The Z coordinates of the nodes. These are stored only if `NDIM > 2`; otherwise, pass in a dummy address.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following will write the nodal coordinates to an open EXODUS II file:

```

      real x(8), y(8), dummy(1)
c
c write nodal coordinates values for a 2-d model to the database
c
      x(1) = 0.0
      x(2) = 1.0
      x(3) = 1.0
      x(4) = 0.0

```

```

x(5) = 1.0
x(6) = 2.0
x(7) = 2.0
x(8) = 1.0
y(1) = 0.0
y(2) = 0.0
y(3) = 1.0
y(4) = 1.0
y(5) = 0.0
y(6) = 0.0
y(7) = 1.0
y(8) = 1.0

call expcor (idexo, x, y, dummy, ierr)

```

5.2.2 Read Nodal Coordinates

The function `ex_get_coord` or (`EXGCOR` for Fortran) reads the coordinates of the nodes. Memory must be allocated for the coordinate arrays (`x_coor`, `y_coor`, and `z_coor`) before this call is made. The length of each of these arrays is the number of nodes in the mesh.

Because the coordinates are floating point values, the application code must declare the arrays passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_coord` returns a negative number; a warning will return a positive number. `EXGCOR` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if nodal coordinates were not stored.

ex_get_coord: C Interface

```

int ex_get_coord (exoid, x_coor, y_coor, z_coor);

```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`void* x_coor (W)`
Returned X coordinates of the nodes. These are returned only if `x_coor` is non-NULL.

`void* y_coor (W)`
Returned Y coordinates of the nodes. These are returned only if `y_coor` is non-NULL and `num_dim > 1`; otherwise, pass in a dummy address.

`void* z_coor (W)`
Returned Z coordinates of the nodes. These are returned only if `z_coor` is non-NULL and `num_dim > 2`; otherwise, pass in a dummy address.

The following code segment will read the nodal coordinates from an open EXODUS II file:

```
int error, exoid;
float *x, *y, *z;

/* read nodal coordinates values from database */
x = (float *) calloc(num_nodes, sizeof(float));
y = (float *) calloc(num_nodes, sizeof(float));
if (num_dim >= 3)
    z = (float *) calloc(num_nodes, sizeof(float));
else
    z = 0;
error = ex_get_coord (exoid, x, y, z);
error = ex_get_coord (exoid, NULL, y, NULL); /* Read only Y coordinate */
```

EXGCOR: Fortran Interface

```
SUBROUTINE EXGCOR (IDEXO, XN, YN, ZN, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

REAL XN(*) (W)
Returned X coordinates of the nodes.

REAL YN(*) (W)
Returned Y coordinates of the nodes. These are returned only if `NDIM > 1`; otherwise, pass in a dummy address.

REAL ZN(*) (W)
Returned Z coordinates of the nodes. These are returned only if `NDIM > 2`; otherwise, pass in a dummy address.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code segment will read the nodal coordinates from an open EXODUS II file:

```
c NOTE:                                MAXNOD is the maximum number of nodes
c
c   real x(MAXNOD), y(MAXNOD), z(MAXNOD)
c
c read nodal coordinates values from database
c
c
c   call exgcor (idexo, x, y, z, ierr)
```

5.2.3 Write Coordinate Names

The function `ex_put_coord_names` or (`EXPCON` for Fortran) writes the names of the coordinate arrays to the database. The function `ex_put_init` (`EXPINI` for Fortran) must be invoked before this call is made.

In case of an error, `ex_put_coord_names` returns a negative number; a warning will return a positive number. `EXPCON` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).

ex_put_coord_names: C Interface

```
int ex_put_coord_names (exoid, coord_names);
```

`int exoid` (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`char** coord_names` (R)
Array containing `num_dim` names (of length `MAX_STR_LENGTH`) of the nodal coordinate arrays.

The following coding will write the coordinate names to an open EXODUS II file:

```
int error, exoid;
char *coord_names[3];

coord_names[0] = "xcoor";
coord_names[1] = "ycoor";
coord_names[2] = "zcoor";

error = ex_put_coord_names (exoid, coord_names);
```

EXPCON: Fortran Interface

```
SUBROUTINE EXPCON (IDEXO, NAMECO, IERR)
```

`INTEGER IDEXO` (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`CHARACTER*MXSTLN NAMECO(*)` (R)
Array containing `NDIM` names for the nodal coordinate arrays.

`INTEGER IERR` (W)
Returned error code. If no errors occurred, 0 is returned.

The following coding will write the coordinate names to an open EXODUS II file:

```
include 'exodusII.inc'
character*(MXSTLN) coord_names(3)

coord_names(1) = "xcoor"
coord_names(2) = "ycoor"
coord_names(3) = "zcoor"
```

```
call expcon (idexo, coord_names, ierr)
```

5.2.4 Read Coordinate Names

The function `ex_get_coord_names` or (`EXGCON` for Fortran) reads the names (`MAX_STR_LENGTH`-characters in length) of the coordinate arrays from the database. Memory must be allocated for the character strings before this function is invoked.

In case of an error, `ex_get_coord_names` returns a negative number; a warning will return a positive number. `EXGCON` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if coordinate names were not stored.

`ex_get_coord_names`: C Interface

```
int ex_get_coord_names (exoid, coord_names);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char** coord_names (W)

Returned pointer to a vector containing `num_dim` names of the nodal coordinate arrays.

The following code segment will read the coordinate names from an open EXODUS II file:

```
int error, exoid;
char *coord_names[3];

for (i=0; i<num_dim; i++)
    coord_names[i] = (char *) calloc ((MAX_STR_LENGTH+1), sizeof(char));

error = ex_get_coord_names (exoid, coord_names);
```

`EXGCON`: Fortran Interface

```
SUBROUTINE EXGCON (IDEXO, NAMECO, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

CHARACTER*MXSTLN NAMECO(*) (W)

Returned array containing `NDIM` names for the nodal coordinate arrays.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will read the coordinate names from an open EXODUS II file:

```
character*(MXSTLN) coord_names(3)

call exgcon (idexo, coord_names, ierr)
```

5.2.5 Write Node Number Map

The function `ex_put_node_num_map` (or `EXPNNM` for Fortran) writes out the optional node number map to the database. The function `ex_put_init` (`EXPINI` for Fortran) must be invoked before this call is made.

In case of an error, `ex_put_node_num_map` returns a negative number; a warning will return a positive number. `EXPNNM` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- a node number map already exists in the file.

ex_put_node_num_map: C Interface

```
int ex_put_node_num_map (exoid, node_map);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int* node_map (R)`
The node number map.

The following code generates a default node number map and outputs it to an open EXODUS II file. This is a trivial case and included just for illustration. Since this map is optional, it should be written out only if it contains something other than the default map.

```
int *node_map, error, exoid;
node_map = (int *) calloc(num_nodes, sizeof(int));

for (i=1; i<=num_nodes; i++)
    node_map[i-1] = i;

error = ex_put_node_num_map (exoid, node_map);
```

EXPNNM: Fortran Interface

```
SUBROUTINE EXPNNM (IDEXO, MAPNOD, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER MAPNOD(*) (R)

The node number map.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code generates a default node number map and outputs it to an open EXODUS II file. This is a trivial case and included just for illustration. Since this map is optional, it should be written out only if it contains something other than the default map.

```
c NOTE:      MAXNOD is the maximum number of nodes
             integer node_map(MAXNOD)

c write node order map
do 10 i = 1, num_nodes
    node_map(i) = i
10    continue

    call expnnm (idexo, node_map, ierr)
```

5.2.6 Read Node Number Map

The function `ex_get_node_num_map` (or `EXGNNM` for Fortran) reads the optional node number map from the database. If a node number map is not stored in the data file, a default array (1,2,3,...`num_nodes`) is returned. Memory must be allocated for the node number map array (`num_nodes` in length) before this call is made.

In case of an error, `ex_get_node_num_map` returns a negative number; a warning will return a positive number. `EXGNNM` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- if a node number map is not stored, a default map and a warning value are returned.

ex_get_node_num_map: C Interface

```
int ex_get_node_num_map (exoid, node_map);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int* node_map (W)

Returned node number map.

The following code will read a node number map from an open EXODUS II file:

```
int *node_map, error, exoid;

/* read node number map */
node_map = (int *) calloc(num_nodes, sizeof(int));
error = ex_get_node_num_map (exoid, node_map);
```

EXGNNM: Fortran Interface

```
SUBROUTINE EXGNNM (IDEXO, MAPNOD, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER MAPNOD (*) (W)
Returned node number map.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code will read a node number map from an open EXODUS II file:

```
integer node_map(MAXNODES)

call exgnnm (idexo, node_map, ierr)
```

5.2.7 Write Element Number Map

The function `ex_put_elem_num_map` (or `EXPENM` for Fortran) writes out the optional element number map to the database. The function `ex_put_init` (`EXPINI` for Fortran) must be invoked before this call is made.

In case of an error, `ex_put_elem_num_map` returns a negative number; a warning will return a positive number. `EXPENM` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- an element number map already exists in the file.

ex_put_elem_num_map: C Interface

```
int ex_put_elem_num_map (exoid, elem_map);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int* elem_map (R)
The element number map.

The following code generates a default element number map and outputs it to an open EXODUS II file. This is a trivial case and included just for illustration. Since this map is optional, it should be written out only if it contains something other than the default map.

```
int *elem_map, error, exoid;
```

```

elem_map = (int *) calloc(num_elem, sizeof(int));

for (i=1; i<=num_elem; i++)
    elem_map[i-1] = i;

error = ex_put_elem_num_map (exoid, elem_map);

```

EXPENM: Fortran Interface

```

SUBROUTINE EXPENM (IDEXO, MAPEL, IERR)

```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER MAPEL(*) (R)
The element number map.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code generates a default element number map and outputs it to an open EXODUS II file. This is a trivial case and included just for illustration. Since this map is optional, it should be written out only if it contains something other than the default map.

```

c NOTE: MAXELEM is the maximum number of elements
c
c     integer elem_map(MAXELEM)
c
c write element number map
c
c     do 10 i = 1, num_elem
c         elem_map(i) = i
10     continue

call expenm (idexo, elem_map, ierr)

```

5.2.8 Read Element Number Map

The function `ex_get_elem_num_map` (or `EXGENM` for Fortran) reads the optional element number map from the database. If an element number map is not stored in the data file, a default array (1,2,3, . . . num_elem) is returned. Memory must be allocated for the element number map array (num_elem in length) before this call is made.

In case of an error, `ex_get_elem_num_map` returns a negative number; a warning will return a positive number. `EXGENM` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- if an element number map is not stored, a default map and a warning value are returned.

ex_get_elem_num_map: C Interface

```
int ex_get_elem_num_map (exoid, elem_map);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int* elem_map (W)
Returned element number map.

The following code will read an element number map from an open EXODUS II file:

```
int *elem_map, error, exoid;

/* read element number map */
elem_map = (int *) calloc(num_elem, sizeof(int));
error = ex_get_elem_num_map (exoid, elem_map);
```

EXGENM: Fortran Interface

```
SUBROUTINE EXGENM (IDEXO, MAPEL, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER MAPEL(*) (W)
Returned element number map.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code will read an element number map from an open EXODUS II file:

```
integer elem_map(MAXELEM)
c
c read element number map
call exgenm (idexo, elem_map, ierr)
```

5.2.9 Write Element Order Map

The function `ex_put_map` (or `EXPMAP` for Fortran) writes out the optional element order map to the database. The function `ex_put_init` (`EXPINI` for Fortran) must be invoked before this call is made.

In case of an error, `ex_put_map` returns a negative number; a warning will return a positive number. `EXPMAP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).

- an element map already exists in the file.

ex_put_map: C Interface

```
int ex_put_map (exoid, elem_map);
```

int exoid (R)
EXODUS file ID returned from a previous call to ex_create or ex_open.

int* elem_map (R)
The element order map.

The following code generates a default element order map and outputs it to an open EXODUS II file. This is a trivial case and included just for illustration. Since this map is optional, it should be written out only if it contains something other than the default map.

```
int *elem_map, error, exoid;

elem_map = (int *) calloc(num_elem, sizeof(int));

for (i=1; i<=num_elem; i++)
    elem_map[i-1] = i;

error = ex_put_map (exoid, elem_map);
```

EXPMAP: Fortran Interface

```
SUBROUTINE EXPMAP (IDEXO, MAPEL, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER MAPEL(*) (R)
The element order map.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code generates a default element order map and outputs it to an open EXODUS II file. This is a trivial case and included just for illustration. Since this map is optional, it should be written out only if it contains something other than the default map.

```
c NOTE:      MAXELEM is the maximum number of elements
             integer elem_map(MAXELEM)

c write element order map
   do 10 i = 1, num_elem
       elem_map(i) = i
10  continue

       call expmap (idexo, elem_map, ierr)
```

5.2.10 Read Element Order Map

The function `ex_get_map` (or `EXGMAP` for Fortran) reads the element order map from the database. If an element order map is not stored in the data file, a default array (1,2,3, . . . `num_elem`) is returned. Memory must be allocated for the element map array (`num_elem` in length) before this call is made.

In case of an error, `ex_get_map` returns a negative number; a warning will return a positive number. `EXGMAP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- if an element order map is not stored, a default map and a warning value are returned.

ex_get_map: C Interface

```
int ex_get_map (exoid, elem_map);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int* elem_map (W)`
Returned element order map.

The following code will read an element order map from an open EXODUS II file:

```
int *elem_map, error, exoid;

/* read element order map */
elem_map = (int *) calloc(num_elem, sizeof(int));
error = ex_get_map (exoid, elem_map);
```

EXGMAP: Fortran Interface

```
SUBROUTINE EXGMAP (IDEXO, MAPEL, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER MAPEL(*) (W)`
Returned element order map.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

The following code will read an element order map from an open EXODUS II file:

```
integer elem_map(MAXELEM)
c read element order map
call exgmap (idexo, elem_map, ierr)
```

5.2.11 Write Element Block Parameters

The function `ex_put_elem_block` (or `EXPELB` for Fortran) writes the parameters used to describe an element block.

In case of an error, `ex_put_elem_block` returns a negative number; a warning will return a positive number. `EXPELB` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- an element block with the same ID has already been specified.
- the number of element blocks specified in the call to `ex_put_init` (`EXPINI` for Fortran) has been exceeded.

ex_put_elem_block: C Interface

```
int ex_put_elem_block (exoid, elem_blk_id, elem_type, num_elem_this_blk,  
                      num_nodes_per_elem, num_attr);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int elem_blk_id (R)

The element block ID.

char* elem_type (R)

The type of elements in the element block. The maximum length of this string is `MAX_STR_LENGTH`. For historical reasons, this string should be all upper case.

int num_elem_this_blk (R)

The number of elements in the element block.

int num_nodes_per_elem (R)

The number of nodes per element in the element block.

int num_attr (R)

The number of attributes per element in the element block.

For example, the following code segment will initialize an element block with an ID of 10, write out the connectivity array, and write out the element attributes array:

```
int id, error, exoid, num_elem_in_blk, num_nodes_per_elem,  
    *connect, num_attr;  
float *attrib;  
  
/* write element block parameters */  
  
id = 10;  
num_elem_in_blk = 2;
```

```

num_nodes_per_elem = 4;                                /* elements are 4-node
shells */
num_attr = 1;                                           /* one attribute per
element */

error = ex_put_elem_block (exoid, id, "SHEL",
    num_elem_in_blk, num_nodes_per_elem, num_attr);

/* write element connectivity */

connect = (int *)
    calloc (num_elem_in_blk*num_nodes_per_elem, sizeof(int));

/* fill connect with node numbers; nodes for first element*/
connect[0] = 1; connect[1] = 2; connect[2] = 3; connect[3] = 4;
/* nodes for second element */
connect[4] = 5; connect[5] = 6; connect[6] = 7; connect[7] = 8;

error = ex_put_elem_conn (exoid, id, connect);

/* write element block attributes */

attrib = (float *) calloc (num_attr * num_elem_in_blk, sizeof(float));

for (i=0, cnt=0; i<num_elem_in_blk; i++)
    for (j=0; j<num_attr; j++, cnt++)
        attrib[cnt] = 1.0;

error = ex_put_elem_attr (exoid, id, attrib);

```

EXPELB: Fortran Interface

```

SUBROUTINE EXPELB (IDEXO, IDELB, NAMELB, NUMELB, NUMLNK, NUMATR, IERR)
INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.
INTEGER IDELB (R)
    The element block ID.
CHARACTER*MXSTLN NAMELB (R)
    The type of elements in the element block. For historical reasons, this string should be all
    upper case.
INTEGER NUMELB (R)
    The number of elements in the element block.
INTEGER NUMLNK (R)
    The number of nodes per element in the element block.
INTEGER NUMATR (R)
    The number of attributes per element in the element block.
INTEGER IERR (W)
    Returned error code. If no errors occurred, 0 is returned.

```

For example, the following code segment will initialize an element block with an ID of 10, write out the connectivity array, and write out the element attributes array:

```
c NOTE: MAXLNK is the maximum number of nodes per element
c       MAXELB is the maximum number of elements per element block
c       MAXATR is the maximum number of attributes per element
c
c       include 'exodusII.inc'
c
c       integer ebid, connect(MAXLNK * MAXELB)
c       real attrib(MAXATR * MAXELB)
c       character*(MXSTLN) cname
c
c write element block parameters
c
c       ebid = 10
c       cname = "SHEL"
c       numelb = 2
c       numlnk = 4
c       numatr = 1
c
c       call expelb (idexo, ebid, cname, numelb, numlnk, numatr, ierr)
c
c fill element connectivity and write it out;
c nodes for first element
c       connect(1) = 1
c       connect(2) = 2
c       connect(3) = 3
c       connect(4) = 4
c
c nodes for second element
c       connect(5) = 5
c       connect(6) = 6
c       connect(7) = 7
c       connect(8) = 8
c
c       call expelc (idexo, ebid, connect, ierr)
c
c write element block attributes
c
c       icnt = 0
c       do 20 i=1,numelb
c         do 10 j=1,numatr
c           icnt = icnt + 1
c           attrib(icnt) = 1.0
10      continue
20      continue
c
c       call expeat (idexo, ebid, attrib, ierr)
```

5.2.12 Read Element Block Parameters

The function `ex_get_elem_block` (or `EXGELB` for Fortran) reads the parameters used to describe an element block. IDs of all element blocks stored can be determined by calling `ex_get_elem_blk_ids` (`EXGEBI` for Fortran).

In case of an error, `ex_get_elem_block` returns a negative number; a warning will return a positive number. `EXGELB` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- element block with specified ID is not stored in the data file.

ex_get_elem_block: C Interface

```
int ex_get_elem_block (exoid, elem_blk_id, elem_type, num_elem_this_blk,
                      num_nodes_per_elem, num_attr);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int elem_blk_id (R)

The element block ID.

char* elem_type (W)

Returned type of elements in the element block. The maximum length of this string is `MAX_STR_LENGTH`.

int* num_elem_this_blk (W)

Returned number of elements in the element block.

int* num_nodes_per_elem (W)

Returned number of nodes per element in the element block.

int* num_attr (W)

Returned number of attributes per element in the element block.

As an example, the following code segment will read the parameters for the element block with an ID of 10 and read the connectivity and element attributes arrays from an open EXODUS II file:

```
#include "exodusII.h"
int id, error, exoid, num_el_in_blk, num_nod_per_el, num_attr, *connect;
float *attrib;
char elem_type[MAX_STR_LENGTH+1];

/* read element block parameters */
id = 10;
error = ex_get_elem_block (exoid, id, elem_type,
                          &num_el_in_blk, &num_nod_per_elem, &num_attr);

/* read element connectivity */
```

```
connect = (int *) calloc(num_nod_per_el*num_el_in_blk, sizeof(int));
error = ex_get_elem_conn (exoid, id, connect);
/* read element block attributes */
attrib = (float *) calloc (num_attr * num_el_in_blk, sizeof(float));
error = ex_get_elem_attr (exoid, id, attrib);
```

EXGELB: Fortran Interface

```
SUBROUTINE EXGELB (IDEXO, IDELB, NAMELB, NUMELB, NUMLNK, NUMATR, IERR)
INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.
INTEGER IDELB (R)
    The element block ID.
CHARACTER*MXSTLN NAMELB (W)
    The type of elements in the element block.
INTEGER NUMELB (W)
    Returned number of elements in the element block.
INTEGER NUMLNK (W)
    Returned number of nodes per element in the element block.
INTEGER NUMATR (W)
    Returned number of attributes per element in the element block.
INTEGER IERR (W)
    Returned error code. If no errors occurred, 0 is returned.
```

As an example, the following code segment will read the parameters for the element block with an ID of 10 and the connectivity and element attributes arrays associated with that element block:

```
c NOTE: MAXLNK is the maximum number of nodes per element
c       MAXELB is the maximum number of elements per element block
c       MAXATR is the maximum number of attributes per element

    include 'exodusII.inc'

    integer connect(MAXLNK * MAXELB)
    real attrib(MAXATR * MAXELB)
    character*(MXSTLN) typ
c
c read element block parameters
    id = 10
    call exgelb (idexo, id, typ, numelb, numlnk, numatt, ierr)
c
c read element connectivity
    call exgelc (idexo, id, connect, ierr)
c
c read element block attributes
    call exgeat (idexo, id, attrib, ierr)
```

5.2.13 Write All Element Block Parameters

If element blocks are written using `ex_put_elem_block` (or `EXPELB` for Fortran), significant inefficiencies can result, because the netcdf file is completely re-written after each call. For large files with many element blocks this can be prohibitively slow. To avoid this problem, the function `ex_put_concat_elem_block` (or `EXPCLB` for Fortran) may be used to write the block parameters for all element blocks in a single call.

In case of an error, `ex_put_concat_elem_block` returns a negative number; a warning will return a positive number. `EXPCLB` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).

ex_put_concat_elem_block: C Interface

```
int ex_put_concat_elem_block(exoid, elem_blk_id, elem_type,
    num_elem_this_blk, num_nodes_per_elem, num_attr, define_maps);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_blk_ids (R)`
An array of the element block IDs.

`char* elem_type[] (R)`
The type of elements in each of the element blocks. The maximum length of this string is `MAX_STR_LENGTH`.

`int* num_elem_this_blk (R)`
The number of elements in each of the element blocks.

`int* num_nodes_per_elem (R)`
The number of nodes per element in each of the element blocks.

`int define_maps (R)`
Zero if `node_number_map` and `element_number_map` will not be written later; nonzero if they will. This is just an optimization that will predefine the space for the maps now if they will be written later.

`int *num_attr (R)`
The number of attributes per element in each of the element blocks.

See the section on `ex_put_elem_block` for an example.

EXPCLB: Fortran Interface

```
SUBROUTINE EXPCLB (IDEXO, IDELB, NAMELB, NUMELB, NUMLNK, NUMATR, MKMAPS,
    IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDELB(*) (R)

The element block IDs for all element blocks.

CHARACTER*MXSTLN NAMELB(*) (R)

The type of elements for all element blocks.

INTEGER NUMELB(*) (R)

The number of elements in each element block.

INTEGER NUMLNK (R)

The number of nodes per element in each element block.

INTEGER NUMATR (R)

The number of attributes per element in each element block.

INTEGER MKMAPS (R)

Zero if node_number_map and element_number_map will not be written later; nonzero if they will. This is just an optimization that will predefine the space for the maps now if they will be written later.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

5.2.14 Read Element Blocks IDs

The function `ex_get_elem_blk_ids` (or `EXGEBI` for Fortran) reads the IDs of all of the element blocks. Memory must be allocated for the returned array of (`num_elem_blk`) IDs before this function is invoked. The required size (`num_elem_blk`) can be determined via a call to `ex_inquire` (or `EXINQ` for Fortran).

In case of an error, `ex_get_elem_blk_ids` returns a negative number; a warning will return a positive number. `EXGEBI` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).

ex_get_elem_blk_ids: C Interface

```
int ex_get_elem_blk_ids (exoid, elem_blk_ids);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int* elem_blk_ids (W)

Returned array of the element blocks IDs. The order of the IDs in this array reflects the sequence that the element blocks were introduced into the file.

The following code segment reads all the element block IDs:

```
int error, exoid, *idelbs, num_elem_blk;

idelbs = (int *) calloc(num_elem_blk, sizeof(int));

error = ex_get_elem_blk_ids (exoid, idelbs);
```

EXGEBI: Fortran Interface

```
SUBROUTINE EXGEBI (IDEXO, IDELBS, IERR)

INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDELBS (*) (W)
    Returned array of element blocks IDs. The order of the IDs in this array reflects the
    sequence that the element blocks were introduced into the file.

INTEGER IERR (W)
    Returned error code. If no errors occurred, 0 is returned.
```

The following code segment reads all the element block IDs:

```
c NOTE: MAXEBL is the maximum number of element blocks
c
    integer idelbs(MAXEBL)
    call exgebi (idexo, idelbs, ierr)
```

5.2.15 Write Element Block Connectivity

The function `ex_put_elem_conn` (or `EXPELC` for Fortran) writes the connectivity array for an element block. The function `ex_put_elem_block` (`EXPELB` for Fortran) must be invoked before this call is made.

In case of an error, `ex_put_elem_conn` returns a negative number; a warning will return a positive number. `EXPELC` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_elem_block` was not called previously.

ex_put_elem_conn: C Interface

```
int ex_put_elem_conn (exoid, elem_blk_id, connect);

int exoid (R)
    EXODUS file ID returned from a previous call to ex_create or ex_open.

int elem_blk_id (R)
    The element block ID.
```

`int connect[num_elem_this_blk,num_nodes_per_elem] (R)`

The connectivity array; a list of nodes (internal node IDs; see Node Number Map) that define each element in the element block. The node index cycles faster than the element index.

Refer to the description of `ex_put_elem_block` (EXPELB for Fortran) for an example of a code segment that writes out the connectivity array for an element block.

EXPELC: Fortran Interface

SUBROUTINE EXPELC (IDEXO, IDELB, LINK, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDELB (R)

The element block ID.

INTEGER LINK(NUMLNK,NUMELB) (R)

The connectivity array; a list of nodes (internal node IDs; see Node Number Map) that define each element. The node index cycles faster than the element index.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

Refer to the description of `ex_put_elem_block` (EXPELB for Fortran) for an example of a code segment that writes out the connectivity array for an element block.

5.2.16 Read Element Block Connectivity

The function `ex_get_elem_conn` (or EXGELC for Fortran) reads the connectivity array for an element block. Memory must be allocated for the connectivity array (`num_elem_this_blk * num_nodes_per_elem` in length) before this routine is called.

In case of an error, `ex_get_elem_conn` returns a negative number; a warning will return a positive number. **EXGELC** returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- an element block with the specified ID is not stored in the file.

ex_get_elem_conn: C Interface

`int ex_get_elem_conn (exoid, elem_blk_id, connect);`

`int exoid (R)`

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_blk_id (R)`

The element block ID.

`int connect[num_elem_this_blk,num_nodes_per_elem] (W)`

Returned connectivity array; a list of nodes (internal node IDs; see Node Number Map) that define each element. The node index cycles faster than the element index.

For an example of a code segment that reads the connectivity for an element block, refer to the description of `ex_get_elem_block`.

EXGELC: Fortran Interface

SUBROUTINE EXGELC (IDEXO, IDELB, LINK, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER IDELB (R)

The element block ID.

INTEGER LINK (NUMLNK, NUMELB) (W)

Returned connectivity array; a list of nodes (internal node IDs; see Node Number Map) that define each element. The node index cycles faster than the element index.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For an example of a code segment that reads the connectivity for an element block, refer to the description of `EXGELB`.

5.2.17 Write Element Block Attributes

The function `ex_put_elem_attr` (or `EXPEAT` for Fortran) writes the attributes for an element block. Each element in the element block must have the same number of attributes, so there are $(\text{num_attr} * \text{num_elem_this_blk})$ attributes for each element block. The function `ex_put_elem_block` (`EXPELB` for Fortran) must be invoked before this call is made.

Because the attributes are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_elem_attr` returns a negative number; a warning will return a positive number. `EXPEAT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_elem_block` was not called previously for specified element block ID.

- `ex_put_elem_block` was called with 0 attributes specified.

ex_put_elem_attr: C Interface

```
int ex_put_elem_attr (exoid, elem_blk_id, attrib);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_blk_id (R)`
The element block ID.

`void attrib[num_elem_this_blk,num_attr] (R)`
The list of attributes for the element block. The `num_attr` index cycles faster.

Refer to the description of `ex_put_elem_block` for an example of a code segment that writes out the attributes array for an element block.

EXPEAT: Fortran Interface

```
SUBROUTINE EXPEAT (IDEXO, IDELB, ATRIB, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDELB (R)`
The element block ID.

`REAL ATRIB(NUMATR,NUMELB) (R)`
The list of attributes for the element block. The `NUMATR` index cycles faster.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

Refer to the description of `EXPELB` for an example of a code segment that writes out the attributes array for an element block.

5.2.18 Read Element Block Attributes

The function `ex_get_elem_attr` (or `EXGEAT` for Fortran) reads the attributes for an element block. Memory must be allocated for $(\text{num_attr} * \text{num_elem_this_blk})$ attributes before this routine is called.

Because the attributes are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_elem_attr` returns a negative number; a warning will return a positive number. `EXGEAT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid element block ID.
- a warning value is returned if no attributes are stored in the file.

ex_get_elem_attr: C Interface

```
int ex_get_elem_attr (exoid, elem_blk_id, attrib);
```

`int exoid` (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_blk_id` (R)
The element block ID.

`void attrib[num_elem_this_blk,num_attr]` (W)
Returned list of $(\text{num_attr} * \text{num_elem_this_blk})$ attributes for the element block, with the `num_attr` index cycling faster.

For an example of a code segment that reads the element attributes for an element block, refer to the description of `ex_get_elem_block`.

EXGEAT: Fortran Interface

```
SUBROUTINE EXGEAT (IDEXO, IDELB, ATRIB, IERR)
```

`INTEGER IDEXO` (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDELB` (R)
The element block ID.

`REAL ATRIB(NUMATR,NUMELB)` (W)
Returned list of $(\text{NUMATR} * \text{NUMELB})$ attributes for the element block, with the `NUMATR` index cycling faster.

`INTEGER IERR` (W)
Returned error code. If no errors occurred, 0 is returned.

For an example of a code segment that reads the element attributes for an element block, refer to the description of `EXGELB`.

5.2.19 Write One Element Block Attribute

The function `ex_put_one_elem_attr` writes a single attribute for an element block. Each element in the element block must have the same number of attributes, so there are $(\text{num_attr} * \text{num_elem_this_blk})$ attributes for each element block. The function `ex_put_elem_block` (`EXPELB` for Fortran) must be invoked before this call is made.

Because the attributes are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_elem_attr` returns a negative number; a warning will return a positive number. `EXPEAT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_elem_block` was not called previously for specified element block ID.
- `ex_put_elem_block` was called with 0 attributes specified.
- the specified attribute index is larger than the number of attributes for this element block.

ex_put_one_elem_attr: C Interface

```
int ex_put_one_elem_attr (exoid, elem_blk_id, attribute_index, attrib);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_blk_id (R)`
The element block ID.

`int attribute_index (R)`
The index of the attribute to write (1..number of attributes).

`void attrib[num_elem_this_blk] (R)`
The values of the specified attribute for the element block.

Refer to the description of `ex_put_elem_block` for an example of a code segment that writes out the attributes array for an element block.

5.2.20 Read One Element Block Attribute

The function `ex_get_one_elem_attr` reads a single specified attributes for an element block. Memory must be allocated for `(num_elem_this_blk)` attribute values before this routine is called.

Because the attributes are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_one_elem_attr` returns a negative number; a warning will return a positive number. `EXGEAT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid element block ID.
- a warning value is returned if no attributes are stored in the file.
- the attribute index is larger than the number of attributes for this element block.

ex_get_elem_attr: C Interface

```
int ex_get_one_elem_attr (exoid, elem_blk_id, attribute_index, attrib);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_blk_id (R)`
The element block ID.

`int attribute_index (R)`
The index of the attribute to read (1..number of attributes).

`void attrib[num_elem_this_blk] (W)`
Returned list of `(num_elem_this_blk)` attribute values for the specified attribute for the element block.

For an example of a code segment that reads the element attributes for an element block, refer to the description of `ex_get_elem_block`.

5.2.21 Write Attribute Names

The function `ex_put_elem_attr_names` or (`EXPEAN` for Fortran) writes the names of the attributes for a specified element block to the database. The element blocks must be defined via a call to `ex_put_elem_block` before this call is made.

In case of an error, `ex_put_elem_attr_names` returns a negative number; a warning will return a positive number. `EXPEAN` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_elem_block` was not called previously for specified element block ID.
- The specified element block has zero attributes specified.
- No element blocks with the specified ID are present on the database.

ex_put_elem_attr_names: C Interface

```
int ex_put_elem_attr_names (exoid, elem_block_id, attr_names);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_block_id (r)`
The element block ID.

`char** attr_names (R)`
Array containing `num_attr` names (of length `MAX_STR_LENGTH`) of the attributes for the element block with id `elem_block_id`.

EXPEAN: Fortran Interface

```
SUBROUTINE EXPEAN (IDEXO, IDELB, NAMEAT, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDELB (R)`
The element block ID.

`CHARACTER*MXSTLN NAMEAT(*) (R)`
Array containing `NUMATR` names of the attributes for the element block with ID `IDELB`.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

5.2.22 Read Attribute Names

The function `ex_get_elem_attr_names` or (`EXGEAN` for Fortran) reads the names (`MAX_STR_LENGTH`-characters in length) of the attribute arrays from the database for the specified element block. Memory must be allocated for the character strings before this function is invoked.

In case of an error, `ex_get_attr_names` returns a negative number; a warning will return a positive number. `EXGCON` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid element block ID
- a warning value is returned if attribute names were not stored.

ex_get_elem_attr_names: C Interface

```
int ex_get_elem_attr_names (exoid, elem_block_id, attr_names);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int elem_block_id`
The element block ID.

`char** attr_names (W)`
Returned pointer to a vector containing `num_attr` names of the element attributes for the element block with ID `elem_block_id`.

EXGEAN: Fortran Interface

```
SUBROUTINE EXGEAN (IDEXO, IDELB, NAMEAT, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDELB`
The element block ID.

`CHARACTER*MXSTLN NAMEAT(*) (W)`
Returned array containing `NUMATR` names for the element attributes for the element block with ID `IDELB`.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

5.2.23 Write Node Set Parameters

The function `ex_put_node_set_param` (or `EXPNP` for Fortran) writes the node set ID, the number of nodes which describe a single node set, and the number of distribution factors for the node set.

In case of an error, `ex_put_node_set_param` returns a negative number; a warning will return a positive number. `EXPNP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
 - data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
 - the number of node sets specified in the call to `ex_put_init` (`EXPINI` for Fortran) was zero or has been exceeded.
- a node set with the same ID has already been stored.
- the specified number of distribution factors is not zero and is not equal to the number of nodes.

ex_put_node_set_param: C Interface

```
int ex_put_node_set_param (exoid, node_set_id, num_nodes_in_set,
                          num_dist_in_set);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int node_set_id (R)

The node set ID.

int num_nodes_in_set (R)

The number of nodes in the node set.

int num_dist_in_set (R)

The number of distribution factors in the node set. This should be either 0 (zero) for no factors, or should equal `num_nodes_in_set`.

The following code segment will write out a node set to an open EXODUS II file:

```
int id, num_nodes_in_set, num_dist_in_set, error, exoid, *node_list;
float *dist_fact;

/* write node set parameters */

id = 20; num_nodes_in_set = 5; num_dist_in_set = 5;
error = ex_put_node_set_param (exoid, id, num_nodes_in_set,
                              num_dist_in_set);

/* write node set node list */
node_list = (int *) calloc (num_nodes_in_set, sizeof(int));
node_list[0] = 100; node_list[1] = 101; node_list[2] = 102;
node_list[3] = 103; node_list[4] = 104;
error = ex_put_node_set (exoid, id, node_list);

/* write node set distribution factors */

dist_fact = (float *) calloc (num_dist_in_set, sizeof(float));
dist_fact[0] = 1.0; dist_fact[1] = 2.0; dist_fact[2] = 3.0;
```

```
dist_fact[3] = 4.0; dist_fact[4] = 5.0;
error = ex_put_node_set_dist_fact (exoid, id, dist_fact);
```

EXPNP: Fortran Interface

```
SUBROUTINE EXPNP (IDEXO, IDNPS, NNNPS, NDNPS, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDNPS (R)
The node set ID.

INTEGER NNNPS (R)
The number of nodes in the node set.

INTEGER NDNPS (R)
The number of distribution factors in the node set. This should be either 0 (zero) for no factors, or should equal NNNPS.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code segment will write out a node set to an open EXODUS II file:

```
integer node_list(5)
real dist_fact(5)
c
c write a single node set
c
call expnp (idexo, 20, 4, 4, ierr)
node_list(1) = 100
node_list(2) = 101
node_list(3) = 102
node_list(4) = 103

dist_fact(1) = 1.0
dist_fact(2) = 2.0
dist_fact(3) = 3.0
dist_fact(4) = 4.0

call expns (idexo, 20, node_list, ierr)
call expnsd (idexo, 20, dist_fact, ierr)
```

5.2.24 Read Node Set Parameters

The function `ex_get_node_set_param` (or `EXGNP` for Fortran) reads the number of nodes which describe a single node set and the number of distribution factors for the node set.

In case of an error, `ex_get_node_set_param` returns a negative number; a warning will return a positive number. `EXGNP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (EXCRE or EXOPEN for Fortran).
- a warning value is returned if no node sets are stored in the file.
- incorrect node set ID.

ex_get_node_set_param: C Interface

```
int ex_get_node_set_param (exoid, node_set_id, num_nodes_in_set,
                           num_dist_in_set);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int node_set_id (R)

The node set ID.

int* num_nodes_in_set (W)

Returned number of nodes in the node set.

int* num_dist_in_set (W)

Returned number of distribution factors in the node set.

The following code segment will read a node set from an open EXODUS II file:

```
int error, exoid, id, num_nodes_in_set, num_df_in_set, *node_list;
float *dist_fact;

/* read node set parameters */

id = 100;
error = ex_get_node_set_param (exoid, id, &num_nodes_in_set,
                              &num_df_in_set);

/* read node set node list */

node_list = (int *) calloc(num_nodes_in_set, sizeof(int));
error = ex_get_node_set (exoid, id, node_list);

/* read node set distribution factors */

if (num_df_in_set > 0) {
    dist_fact = (float *)          calloc(num_nodes_in_set,
sizeof(float));
    error = ex_get_node_set_dist_fact (exoid, id, dist_fact); }
```

EXGNP: Fortran Interface

```
SUBROUTINE EXGNP (IDEXO, IDNPS, NNNPS, NDNPS, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDNPS (R)

The node set ID.

INTEGER NNNPS (W)

Returned number of nodes in the node set.

INTEGER NDNPS (W)

Returned number of distribution factors in the node set.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will read all node sets from an open EXODUS II file:

```
c NOTE: MAXNS is the maximum number of node sets
c       MAXNOD is the maximum number of nodes in a node set
c
c       integer ids(MAXNS), node_list(MAXNOD)
c       real dist_fact(MAXNOD)
c
c read individual node sets
c
c       if (num_node_sets .gt. 0) then
c         call exgnsi (idexo, ids, ierr)
c       endif
c
c       do 100 i = 1, num_node_sets
c         call exgnp (idexo, ids(i), nnnps, numdf, ierr)
c         call exgns (idexo, ids(i), node_list, ierr)
c         call exgnsd (idexo, ids(i), dist_fact, ierr)
100      continue
```

5.2.25 Write Node Set

The function `ex_put_node_set` (or `EXPNS` for Fortran) writes the node list for a single node set. The function `ex_put_node_set_param` (or `EXPNP` for Fortran) must be called before this routine is invoked.

In case of an error, `ex_put_node_set` returns a negative number; a warning will return a positive number. `EXPNS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_node_set_param` (or `EXPNP` for Fortran) not called previously.

`ex_put_node_set`: C Interface

```
int ex_put_node_set (exoid, node_set_id, node_set_node_list);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int node_set_id (R)

The node set ID.

int* node_set_node_list (R)

Array containing the node list for the node set. Internal node IDs are used in this list (see Node Number Map).

Refer to the description of `ex_put_node_set_param` for a sample code segment to write out a node set.

EXPNS: Fortran Interface

```
SUBROUTINE EXPNS (IDEXO, IDNPS, LTNNPS, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER IDNPS (R)

The node set ID.

INTEGER LTNNPS(*) (R)

Array containing the node list for the node set. Internal node IDs are used in this list (see Node Number Map).

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

Refer to the description of `EXPNP` for a sample code segment to write out a node set.

5.2.26 Read Node Set

The function `ex_get_node_set` (or `EXGNS` for Fortran) reads the node list for a single node set. Memory must be allocated for the node list (`num_nodes_in_set` in length) before this function is invoked.

In case of an error, `ex_get_node_set` returns a negative number; a warning will return a positive number. `EXGNS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no node sets are stored in the file.
- incorrect node set ID.

ex_get_node_set: C Interface

```
int ex_get_node_set (exoid, node_set_id, node_set_node_list);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int node_set_id (R)

The node set ID.

int* node_set_node_list (W)

Returned array containing the node list for the node set. Internal node IDs are used in this list (see Node Number Map).

Refer to the description of `ex_get_node_set_param` for a sample code segment to read a node set.

EXGNS: Fortran Interface

```
SUBROUTINE EXGNS (IDEXO, IDNPS, LTNNPS, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER IDNPS (R)

The node set ID.

INTEGER LTNNPS (*) (W)

Returned array containing the node list for the node set. Internal node IDs are used in this list (see Node Number Map).

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

Refer to the description of `EXGNP` for a sample code segment to read a node set.

5.2.27 Write Node Set Distribution Factors

The function `ex_put_node_set_dist_fact` (or `EXPNSD` for Fortran) writes distribution factors for a single node set. The function `ex_put_node_set_param` (or `EXPNP` for Fortran) must be called before this routine is invoked.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_node_set_dist_fact` returns a negative number; a warning will return a positive number. `EXPNSD` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.

- data file not initialized properly with call to `ex_put_init` (EXPINI for Fortran).
- `ex_put_node_set_param` (or EXPNP for Fortran) not called previously.
- a call to `ex_put_node_set_param` (or EXPNP for Fortran) specified zero distribution factors.

ex_put_node_set_dist_fact: C Interface

```
int ex_put_node_set_dist_fact (exoid, node_set_id, node_set_dist_fact);
```

`int exoid` (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int node_set_id` (R)
The node set ID.

`void* node_set_dist_fact` (R)
Array containing the distribution factors in the node set.

Refer to the description of `ex_put_node_set_param` for a sample code segment to write out the distribution factors for a node set.

EXPNSD: Fortran Interface

```
SUBROUTINE EXPNSD (IDEXO, IDNPS, FACNPS, IERR)
```

`INTEGER IDEXO` (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDNPS` (R)
The node set ID.

`REAL FACNPS(*)` (R)
Array containing the distribution factors in the node set.

`INTEGER IERR` (W)
Returned error code. If no errors occurred, 0 is returned.

Refer to the description of `EXPNP` for a sample code segment to write out the distribution factors for a node set.

5.2.28 Read Node Set Distribution Factors

The function `ex_get_node_set_dist_fact` (or `EXGNSD` for Fortran) returns the distribution factors for a single node set. Memory must be allocated for the list of distribution factors (`num_dist_in_set` in length) before this function is invoked.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in

Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_node_set_dist_fact` returns a negative number; a warning will return a positive number. `EXGNSD` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- a warning value is returned if no distribution factors were stored.

ex_get_node_set_dist_fact: C Interface

```
int ex_get_node_set_dist_fact (exoid, node_set_id, node_set_dist_fact);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int node_set_id (R)`
The node set ID.

`void* node_set_dist_fact (W)`
Returned array containing the distribution factors in the node set.

Refer to the description of `ex_get_node_set_param` for a sample code segment to read a node set's distribution factors.

EXGNSD: Fortran Interface

```
SUBROUTINE EXGNSD (IDEXO, IDNPS, FACNPS, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDNPS (R)`
The node set ID.

`REAL FACNPS (*) (W)`
Returned array containing the distribution factors in the node set.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

Refer to the description of `EXGNP` for a sample code segment to read a node set's distribution factors.

5.2.29 Read Node Sets IDs

The function `ex_get_node_set_ids` (or `EXGNSI` for Fortran) reads the IDs of all of the node sets. Memory must be allocated for the returned array of (`num_node_sets`) IDs before this function is invoked.

In case of an error, `ex_get_node_set_ids` returns a negative number; a warning will return a positive number. `EXGNSI` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no node sets are stored in the file.

ex_get_node_set_ids: C Interface

```
int ex_get_node_set_ids (exoid, node_set_ids);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int* node_set_ids (W)`
Returned array of the node sets IDs. The order of the IDs in this array reflects the sequence the node sets were introduced into the file.

As an example, the following code will read all of the node set IDs from an open data file:

```
int *ids, num_node_sets, error, exoid;
/* read node sets IDs */
ids = (int *) calloc(num_node_sets, sizeof(int));
error = ex_get_node_set_ids (exoid, ids);
```

EXGNSI: Fortran Interface

```
SUBROUTINE EXGNSI (IDEXO, IDNPSS, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDNPSS(*) (W)`
Returned array of node sets IDs. The order of the IDs in this array reflects the sequence the node sets were introduced into the file.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

As an example, the following code will read all of the node set IDs from an open EXODUS II file:

```
integer ids(MAXNS)
if (num_node_sets .gt. 0) then
  call exgnsi (idexo, ids, ierr)
endif
```

5.2.30 Write Concatenated Node Sets

The function `ex_put_concat_node_sets` (or `EXPCNS` for Fortran) writes the node set ID's, node sets node count array, node sets distribution factor count array, node sets node list pointers array, node sets distribution factor pointer, node set node list, and node set distribution factors for all of the node sets. "Concatenated node sets" refers to the arrays required to define all of the node sets (ID array, counts arrays, pointers arrays, node list array, and distribution factors array) as described in Con. Writing concatenated node sets is more efficient than writing individual node sets. See Appendix A for a discussion of efficiency issues.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type ("float" or "double" in C; "REAL*4" or "REAL*8" in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

It is possible to use this call to only *define* the node sets on the database and to *write* the node set data using other API functions. This usage is also more efficient than defining individual node sets, but is sometimes easier than defining and writing all node set data at one time. To only define the node sets on the database, pass a NULL for the `node_sets_node_index`, `node_sets_dist_index`, `node_sets_node_list`, and `node_sets_dist_fact` arguments.

In case of an error, `ex_put_concat_node_sets` returns a negative number; a warning will return a positive number. `EXPCNS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the number of node sets specified in a call to `ex_put_init` (`EXPINI` for Fortran) was zero or has been exceeded.
- a node set with the same ID has already been stored.
- the number of distribution factors specified for one of the node sets is not zero and is not equal to the number of nodes in the same node set.

ex_put_concat_node_sets: C Interface

```
int ex_put_concat_node_sets (exoid, node_set_ids, num_nodes_per_set,  
    num_dist_per_set, node_sets_node_index, node_sets_dist_index,  
    node_sets_node_list, node_sets_dist_fact);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int* node_set_ids (R)`
 Array containing the node set ID for each set.

`int* num_nodes_per_set (R)`
 Array containing the number of nodes for each set.

`int* num_dist_per_set (R)`
 Array containing the number of distribution factors for each set.

`int* node_sets_node_index (R)`
 Array containing the indices into the `node_set_node_list` which are the locations of the first node for each set. These indices are 0-based. Pass NULL if only defining node sets with this call.

`int* node_sets_dist_index (R)`
 Array containing the indices into the `node_set_dist_list` which are the locations of the first distribution factor for each set. These indices are 0-based. Pass NULL if only defining node sets with this call.

`int* node_sets_node_list (R)`
 Array containing the nodes for all sets. Internal node IDs are used in this list (see Node Number Map). Pass NULL if only defining node sets with this call.

`void* node_sets_dist_fact (R)`
 Array containing the distribution factors for all sets. Pass NULL if only defining node sets with this call.

For example, the following code will write out two node sets in a concatenated format:

```
int ids[2], num_nodes_per_set[2], node_ind[2], node_list[8],
    num_df_per_set[2], df_ind[2], error, exoid;
float dist_fact[8];

ids[0] = 20; ids[1] = 21;

num_nodes_per_set[0] = 5; num_nodes_per_set[1] = 3;

node_ind[0] = 0; node_ind[1] = 5;

node_list[0] = 100; node_list[1] = 101; node_list[2] = 102;
node_list[3] = 103; node_list[4] = 104;
node_list[5] = 200; node_list[6] = 201; node_list[7] = 202;

num_df_per_set[0] = 5; num_df_per_set[1] = 3;

df_ind[0] = 0; df_ind[1] = 5;

dist_fact[0] = 1.0; dist_fact[1] = 2.0; dist_fact[2] = 3.0;
dist_fact[3] = 4.0; dist_fact[4] = 5.0;
dist_fact[5] = 1.1; dist_fact[6] = 2.1; dist_fact[7] = 3.1;

error = ex_put_concat_node_sets (exoid, ids, num_nodes_per_set,
    num_df_per_set, node_ind, df_ind, node_list, dist_fact);
```

EXPCNS: Fortran Interface

```
SUBROUTINE EXPCNS (IDEXO, IDNPSS, NNNPS, NDNPS, IXNNPS, IXDNPS, LTNNPS,  
                  FACNPS, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

```
INTEGER IDNPSS (*) (R)
```

Array containing the node set ID for each set.

```
INTEGER NNNPS (*) (R)
```

Array containing the number of nodes for each set.

```
INTEGER NDNPS (*) (R)
```

Array containing the number of distribution factors for each set.

```
INTEGER IXNNPS (*) (R)
```

Array containing the indices into the LTNNPS array which are the locations of the first node for each set. These indices are 1-based.

```
INTEGER IXDNPS (*) (R)
```

Array containing the indices into the FACNPS array which are the locations of the first distribution factor for each set. These indices are 1-based.

```
INTEGER LTNNPS (*) (R)
```

Array containing the nodes for all sets. Internal node IDs are used in this list (see Node Number Map).

```
REAL FACNPS (*) (R)
```

Array containing the distribution factors for all sets.

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

For example, the following code writes out two node sets in a concatenated format:

```
integer ids(2), nnnps(2), ndnps(2), nodeind(2), factind(2)  
integer nodelist(8), distfact(8)  
  
ids(1) = 20  
ids(2) = 21  
  
nnnps(1) = 5  
nnnps(2) = 3  
  
ndnps(1) = 5  
ndnps(2) = 3  
  
nodeind(1) = 1  
nodeind(2) = 6  
  
factind(1) = 1  
factind(2) = 6
```

```

nodelist(1) = 100
nodelist(2) = 101
nodelist(3) = 102
nodelist(4) = 103
nodelist(5) = 104
nodelist(6) = 200
nodelist(7) = 201
nodelist(8) = 202

distfact(1) = 1.0
distfact(2) = 2.0
distfact(3) = 3.0
distfact(4) = 4.0
distfact(5) = 5.0
distfact(6) = 1.1
distfact(7) = 2.1
distfact(8) = 3.1

call expcns (idexo, ids, nnnps, ndnps, nodeind, factind, nodelist,
1 distfact, ierr)

```

5.2.31 Read Concatenated Node Sets

The function `ex_get_concat_node_sets` (or `EXGCNS` for Fortran) reads the node set ID's, node set node count array, node set distribution factors count array, node set node pointers array, node set distribution factors pointer array, node set node list, and node set distribution factors for all of the node sets. "Concatenated node sets" refers to the arrays required to define all of the node sets (ID array, counts arrays, pointers arrays, node list array, and distribution factors array) as described in Con.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type ("float" or "double" in C; "REAL*4" or "REAL*8" in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

The length of each of the returned arrays can be determined by invoking `ex_inquire` (or `EXINQ` for Fortran). See Inquire EXODUS Parameters.

In case of an error, `ex_get_concat_node_sets` returns a negative number; a warning will return a positive number. `EXGCNS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no node sets are stored in the file.

ex_get_concat_node_sets: C Interface

```
int ex_get_concat_node_sets (exoid, node_set_ids, num_nodes_per_set,  
    num_dist_per_set, node_sets_node_index, node_sets_dist_index,  
    node_sets_node_list, node_sets_dist_fact);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int* node_set_ids (W)

Returned array containing the node set ID for each set.

int* num_nodes_per_set (W)

Returned array containing the number of nodes for each set.

int* num_dist_per_set (W)

Returned array containing the number of distribution factors for each set.

int* node_sets_node_index (W)

Returned array containing the indices into the `node_set_node_list` which are the locations of the first node for each set. These indices are 0-based.

int* node_sets_dist_index (W)

Returned array containing the indices into the `node_set_dist_fact` which are the locations of the first distribution factor for each set. These indices are 0-based.

int* node_sets_node_list (W)

Returned array containing the nodes for all sets. Internal node IDs are used in this list (see Node Number Map).

void* node_sets_dist_fact (W)

Returned array containing the distribution factors for all sets.

As an example, the following code segment will read concatenated node sets:

```
#include "exodusII.h"  
  
int error, exoid, num_node_sets, list_len, *ids, *num_nodes_per_set,  
    *num_df_per_set, *node_ind, *df_ind, *node_list;  
float *dist_fact  
  
/* read concatenated node sets */  
  
error = ex_inquire (exoid, EX_INQ_NODE_SETS, &num_node_sets, &fdum,  
    cdum);  
  
ids = (int *) calloc(num_node_sets, sizeof(int));  
num_nodes_per_set = (int *) calloc(num_node_sets, sizeof(int));  
num_df_per_set = (int *) calloc(num_node_sets, sizeof(int));  
node_ind = (int *) calloc(num_node_sets, sizeof(int));  
df_ind = (int *) calloc(num_node_sets, sizeof(int));  
  
error = ex_inquire (exoid, EX_INQ_NS_NODE_LEN, &list_len, &fdum, cdum);  
node_list = (int *) calloc(list_len, sizeof(int));
```

```

error = ex_inquire (exoid, EX_INQ_NS_DF_LEN, &list_len, &fdum, cdum);

dist_fact = (float *) calloc(list_len, sizeof(float));

error = ex_get_concat_node_sets (exoid, ids, num_nodes_per_set,
                                num_df_per_set, node_ind, df_ind, node_list, dist_fact);

```

EXGCNS: Fortran Interface

```

SUBROUTINE EXGCNS (IDEXO, IDNPSS, NNNPS, NDNPS, IXNNPS, IXDNPS, LTNNPS,
                  FACNPS, IERR)

INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDNPSS(*) (W)
    Returned array containing the node set ID for each set.

INTEGER NNNPS(*) (W)
    Returned array containing the number of nodes for each set.

INTEGER NDNPS(*) (W)
    Returned array containing the number of distribution factors for each set.

INTEGER IXNNPS(*) (W)
    Returned array containing the indices into the LTNNPS array which are the locations of the
    first node for each set. These indices are 1-based.

INTEGER IXDNPS(*) (W)
    Returned array containing the indices into the FACNPS array which are the locations of the
    first distribution factor for each set. These indices are 1-based.

INTEGER LTNNPS(*) (W)
    Returned array containing the nodes for all sets. Internal node IDs are used in this list (see
    Node Number Map).

REAL FACNPS(*) (W)
    Returned array containing the distribution factors for all sets.

INTEGER IERR (W)
    Returned error code. If no errors occurred, 0 is returned.

```

As an example, the following code segment will read concatenated node sets:

```

c NOTE: MAXNS is the maximum number of node sets
c       MAXNOD is the maximum number of nodes in a node set
c
c       integer ids(MAXNS), numnodes(MAXNS), num_df(MAXNS), node_ind(MAXNS),
c       1 df_ind(MAXNS), node_list(MAXNOD*MAXNS), dist_fact(MAXNOD*MAXNS)
c
c read concatenated node sets
c
c       call exinq (idexo, EXNODS, num_node_sets, fdum, cdum, ierr)

```

```

        if (num_node_sets .gt. 0) then
c
c use the next calls if you can dynamically allocate arrays
c
        call exinq (idexo, EXNSNL, list_len, fdum, cdum, ierr)
        call exinq (idexo, EXNSDF, list_len, fdum, cdum, ierr)

        call exgcns (idexo, ids, numnodes, num_df,
1 node_ind, df_ind, node_list, dist_fact, ierr)
    endif

```

5.2.32 Write Side Set Parameters

The function `ex_put_side_set_param` (or `EXPSP` for Fortran) writes the side set ID and the number of sides (faces on 3-d element types; edges on 2-d element types) which describe a single side set, and the number of distribution factors on the side set. Because each side of a side set is completely defined by an element and a local side number, the number of sides is equal to the number of elements in a side set.

In case of an error, `ex_put_side_set_param` returns a negative number; a warning will return a positive number. `EXPSP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the number of side sets specified in the call to `ex_put_init` (`EXPINI` for Fortran) was zero or has been exceeded.
- a side set with the same ID has already been stored.

`ex_put_side_set_param`: C Interface

```

int ex_put_side_set_param (exoid, side_set_id, num_side_in_set,
    num_dist_fact_in_set);

```

`int exoid (R)`
 EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int side_set_id (R)`
 The side set ID.

`int num_side_in_set (R)`
 The number of sides (faces or edges) in the side set.

`int num_dist_fact_in_set (R)`
 The number of distribution factors on the side set.

The following code segment will write a side set to an open EXODUS II file:

```
int error, exoid, id, num_sides, num_df, elem_list[2], side_list[2];
float dist_fact[4];

/* write side set parameters */

id = 30;
num_sides = 2;
num_df = 4;

error = ex_put_side_set_param (exoid, id, num_sides, num_df);

/* write side set element and side lists */
elem_list[0] = 1; elem_list[1] = 2;
side_list[0] = 1; side_list[1] = 1;

error = ex_put_side_set (exoid, id, elem_list, side_list);

/* write side set distribution factors */

dist_fact[0] = 30.0; dist_fact[1] = 30.1;
dist_fact[2] = 30.2; dist_fact[3] = 30.3;

error = ex_put_side_set_dist_fact (exoid, id, dist_fact);
```

EXPSP: Fortran Interface

```
SUBROUTINE EXPSP (IDEXO, IDESS, NSESS, NDESS, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDESS (R)
The side set ID.

INTEGER NSESS (R)
The number of sides (faces or edges) in the side set.

INTEGER NDESS (R)
The number of distribution factors on the side set.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following code segment will write a side set to an open EXODUS II file:

```
integer elem_list(2), side_list(2)
real dist_fact(4)

id = 31
numsid = 2
numdf = 4
```

```

elem_list(1) = 13
elem_list(2) = 14

side_list(1) = 3
side_list(2) = 4

dist_fact(1) = 31.0
dist_fact(2) = 31.1
dist_fact(3) = 31.2
dist_fact(4) = 31.3

call expsp (idexo, id, numsid, numdf, ierr)
call expss (idexo, id, elem_list, side_list, ierr)
call expssd (idexo, id, dist_fact, ierr)

```

5.2.33 Read Side Set Parameters

The function `ex_get_side_set_param` (or `EXGSP` for Fortran) reads the number of sides (faces on 3-d element types; edges on 2-d element types) which describe a single side set, and the number of distribution factors on the side set.

In case of an error, `ex_get_side_set_param` returns a negative number; a warning will return a positive number. `EXGSP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no side sets are stored in the file.
- incorrect side set ID.

ex_get_side_set_param: C Interface

```

int ex_get_side_set_param (exoid, side_set_id, num_side_in_set,
                           num_dist_fact_in_set);

```

`int exoid` (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int side_set_id` (R)
The side set ID.

`int* num_side_in_set` (W)
Returned number of sides (faces or edges) in the side set.

`int* num_dist_fact_in_set` (W)
Returned number of distribution factors on the side set.

The following coding will read all of the side sets from an open EXODUS II file:

```

int num_side_sets, error, exoid, num_sides_in_set, num_df_in_set,

```

```

    num_elem_in_set, *ids, *elem_list, *side_list, *ctr_list, *node_list;
float *dist_fact;

error = ex_inq (exoid, EX_INQ_SIDE_SETS, &num_side_sets, &fdum, cdum);

ids = (int *) calloc(num_side_sets, sizeof(int));
error = ex_get_side_set_ids (exoid, ids);

for (i=0; i<num_side_sets; i++)
{
    error = ex_get_side_set_param (exoid, ids[i], &num_sides_in_set,
        &num_df_in_set);

    num_elem_in_set = num_sides_in_set;
    elem_list = (int *) calloc(num_elem_in_set, sizeof(int));
    side_list = (int *) calloc(num_sides_in_set, sizeof(int));
    error = ex_get_side_set (exoid, ids[i], elem_list, side_list);
    if (num_df_in_set > 0)
    {
/* get side set node list to correlate to dist factors */
        ctr_list = (int *) calloc(num_elem_in_set, sizeof(int));
        node_list = (int *) calloc(num_df_in_set, sizeof(int));
        dist_fact = (float *) calloc(num_df_in_set, sizeof(float));

        error = ex_get_side_set_node_list (exoid, ids[i], ctr_list,
            node_list);
        error = ex_get_side_set_dist_fact (exoid, ids[i], dist_fact);
    }
}

```

EXGSP: Fortran Interface

```

SUBROUTINE EXGSP (IDEXO, IDESS, NSESS, NDESS, IERR)
INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.
INTEGER IDESS (R)
    The side set ID.
INTEGER NSESS (W)
    Returned number of sides (faces or edges) in the side set.
INTEGER NDESS (W)
    Returned number of distribution factors on the side set.
INTEGER IERR (W)
    Returned error code. If no errors occurred, 0 is returned.

```

The following coding will read all of the side sets from an open EXODUS II file:

```

c NOTE: MAXSS is the maximum number of side sets
c       MAXSID is the maximum number of sides in a side set
c       MAXNOD is the maximum number of nodes on a side set

```

```

integer ids(MAXSS), numsid, numdf, elem1st(MAXSID), sidelst(MAXSID),
1 incnt(MAXSID), nodelst(MAXNOD)
real distfact(MAXNOD)

if (num_side_sets .gt. 0) then
  call exgssi (idexo, ids, ierr)
endif

do 10 i = 1, num_side_sets
  call exgsp (idexo, ids(i), numsid, numdf, ierr)
  call exgss (idexo, ids(i), elem1st, sidelst, ierr)
  call exgssn (idexo, ids(i), incnt, nodelst, ierr)
  call exgssd (idexo, ids(i), distfact, ierr)
10 continue

```

5.2.34 Write Side Set

The function `ex_put_side_set` (or `EXPSS` for Fortran) writes the side set element list and side set side (face on 3-d element types; edge on 2-d element types) list for a single side set. The routine `ex_put_side_set_param` (`EXPSP` for Fortran) must be called before this function is invoked.

In case of an error, `ex_put_side_set` returns a negative number; a warning will return a positive number. `EXPSS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_side_set_param` (or `EXPSP` for Fortran) not called previously.

ex_put_side_set: C Interface

```

int ex_put_side_set (exoid, side_set_id, side_set_elem_list,
                    side_set_side_list);

```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int side_set_id (R)`
The side set ID.

`int* side_set_elem_list (R)`
Array containing the elements in the side set. Internal element IDs are used in this list (see Node Number Map).

`int* side_set_side_list (R)`
Array containing the sides (faces or edges) in the side set.

For an example of a code segment to write a side set, refer to the description for `ex_put_side_set_param`.

EXPSS: Fortran Interface

```
SUBROUTINE EXPSS (IDEXO, IDESS, LTEESS, LTSESS, IERR)
INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.
INTEGER IDESS (R)
    The side set ID.
INTEGER LTEESS(*) (R)
    Array containing the elements in the side set. Internal element IDs are used in this list (see
    Node Number Map).
INTEGER LTSESS(*) (R)
    Array containing the sides (faces or edges) in the side set.
INTEGER IERR (W)
    Returned error code. If no errors occurred, 0 is returned.
```

For an example of a code segment to write a side set, refer to the description for `EXPSP`.

5.2.35 Read Side Set

The function `ex_get_side_set` (or `EXGSS` for Fortran) reads the side set element list and side set side (face for 3-d element types; edge for 2-d element types) list for a single side set. Memory must be allocated for the element list and side list (both are `num_side_in_set` in length) before this function is invoked.

In case of an error, `ex_get_side_set` returns a negative number; a warning will return a positive number. `EXGSS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no side sets are stored in the file.
- incorrect side set ID.

ex_get_side_set: C Interface

```
int ex_get_side_set (exoid, side_set_id, side_set_elem_list,
                    side_set_side_list);

int exoid (R)
    EXODUS file ID returned from a previous call to ex_create or ex_open.
```

`int side_set_id (R)`

The side set ID.

`int* side_set_elem_list (W)`

Returned array containing the elements in the side set. Internal element IDs are used in this list (see Node Number Map).

`int* side_set_side_list (W)`

Returned array containing the sides (faces or edges) in the side set.

For an example of code to read a side set from an EXODUS II file, refer to the description for `ex_get_side_set_param`.

EXGSS: Fortran Interface

```
SUBROUTINE EXGSS (IDEXO, IDESS, LTEESS, LTSESS, IERR)
```

`INTEGER IDEXO (R)`

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDESS (R)`

The side set ID.

`INTEGER LTEESS(*) (W)`

Returned array containing the elements in the side set. Internal element IDs are used in this list (see Node Number Map).

`INTEGER LTSESS(*) (W)`

Returned array containing the faces (or edges) in the side set.

`INTEGER IERR (W)`

Returned error code. If no errors occurred, 0 is returned.

For an example of code to read a side set from an EXODUS II file, refer to the description for `EXGSP`.

5.2.36 Write Side Set Distribution Factors

The function `ex_put_side_set_dist_fact` (or `EXPSSD` for Fortran) writes distribution factors for a single side set. The routine `ex_put_side_set_param` (or `EXPSP` for Fortran) must be called before this function is invoked.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_side_set_dist_fact` returns a negative number; a warning will return a positive number. `EXPSSD` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_side_set_param` (or `EXPSP` for Fortran) not called previously.
- a call to `ex_put_side_set_param` (or `EXPSP` for Fortran) specified zero distribution factors.

ex_put_side_set_dist_fact: C Interface

```
int ex_put_side_set_dist_fact (exoid, side_set_id, side_set_dist_fact);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int side_set_id (R)`
The side set ID.

`void* side_set_dist_fact (R)`
Array containing the distribution factors in the side set.

For an example of a code segment to write side set distribution factors, refer to the description for `ex_put_side_set_param`.

EXPSSD: Fortran Interface

```
SUBROUTINE EXPSSD (IDEXO, IDESS, FACESS, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDESS (R)`
The side set ID.

`REAL FACESS (*) (R)`
Array containing the distribution factors in the side set.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

For an example of a code segment to write side set distribution factors, refer to the description for `EXPSP`.

5.2.37 Read Side Set Distribution Factors

The function `ex_get_side_set_dist_fact` (or `EXGSSD` for Fortran) returns the distribution factors for a single side set. Memory must be allocated for the list of distribution factors (`num_dist_fact_in_set` in length) before this function is invoked.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_side_set_dist_fact` returns a negative number; a warning will return a positive number. `EXGSSD` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- a warning value is returned if no distribution factors were stored.

ex_get_side_set_dist_fact: C Interface

```
int ex_get_side_set_dist_fact (exoid, side_set_id, side_set_dist_fact);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int side_set_id (R)`
The side set ID.

`void* side_set_dist_fact (W)`
Returned array containing the distribution factors in the side set.

For an example of code to read side set distribution factors from an EXODUS II file, refer to the description for `ex_get_side_set_param`.

EXGSSD: Fortran Interface

```
SUBROUTINE EXGSSD (IDEXO, IDESS, FACESS, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDESS (R)`
The side set ID.

`REAL FACESS (*) (W)`
Returned array containing the distribution factors in the side set.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

For an example of code to read side set distribution factors from an EXODUS II file, refer to the description for EXGSP.

5.2.38 Read Side Sets IDs

The function `ex_get_side_set_ids` (or `EXGSSI` for Fortran) reads the IDs of all of the side sets. Memory must be allocated for the returned array of (`num_side_sets`) IDs before this function is invoked.

In case of an error, `ex_get_side_set_ids` returns a negative number; a warning will return a positive number. `EXGSSI` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no side sets are stored in the file.

ex_get_side_set_ids: C Interface

```
int ex_get_side_set_ids (exoid, side_set_ids);
```

`int exoid` (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int* side_set_ids` (W)
Returned array of the side sets IDs. The order of the IDs in this array reflects the sequence the side sets were introduced into the file.

For an example of code to read side set IDs from an EXODUS II file, refer to the description for `ex_get_side_set_param`.

EXGSSI: Fortran Interface

```
SUBROUTINE EXGSSI (IDEXO, IDESSS, IERR)
```

`INTEGER IDEXO` (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER IDESSS(*)` (W)
Returned array of side sets IDs. The order of the IDs in this array reflects the sequence the side sets were introduced into the file.

`INTEGER IERR` (W)
Returned error code. If no errors occurred, 0 is returned.

For an example of code to read side set IDs from an EXODUS II file, refer to the description for EXGSP.

5.2.39 Get Side Set Node List Length

The function `ex_get_side_set_node_list_len` returns the size of the side set node list which is returned from a call to `ex_get_side_set_node_list`. R for more information.

In case of an error, `ex_get_side_set_node_list_len` returns a negative number; a warning will return a positive number. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no side sets are stored in the file.
- incorrect side set ID.

ex_get_side_set_node_list_len: C Interface

```
int ex_get_side_set_node_list_len (exoid, side_set_id, *node_list_len);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int side_set_id (R)
The side set ID.

int* node_list_len (W)
Returned count of the number of nodes that make up the sides in the side set.

5.2.40 Read Side Set Node List

The function `ex_get_side_set_node_list` (or `EXGSSN` for Fortran) returns a node count array and a list of nodes on a single side set. With the 2.0 and later versions of the database, this node list isn't stored directly but can be derived from the element number in the side set element list, local side number in the side set side list, and the element connectivity array. The application program must allocate memory for the node count array and node list.

The length of the node list can be determined by calling `ex_get_side_set_node_list_len`. (Get Side Set Node List Length). There is a one-to-one mapping (i.e., same order -- as shown in **Error! Reference source not found.** -- and same number) between the nodes in the side set node list and the side set distribution factors. Thus, if distribution factors are stored for the side set of interest, the required size for the node list is the number of distribution factors returned by `ex_get_side_set_param` (or `EXGSP` for Fortran).

The length of the node count array is the length of the side set element list. For each entry in the side set element list, there is an entry in the side set side list, designating a local side number. The corresponding entry in the node count array is the number of nodes which define the particular side. In conjunction with the side set node list, this node count array gives an unambiguous nodal description of the side set.

In case of an error, `ex_get_side_set_node_list` returns a negative number; a warning will return a positive number. `EXGSSN` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no side sets are stored in the file.
- incorrect side set ID.

ex_get_side_set_node_list: C Interface

```
int ex_get_side_set_node_list (exoid, side_set_id, side_set_node_cnt_list,
                              side_set_node_list);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int side_set_id (R)

The side set ID.

int* side_set_node_cnt_list (W)

Returned array containing the number of nodes for each side (face in 3-d, edge in 2-d) in the side set.

int* side_set_node_list (W)

Returned array containing a list of nodes on the side set. Internal node IDs are used in this list (see Node Number Map).

For an example of code to read a side set node list from an EXODUS II file, refer to the description for `ex_get_side_set_param`.

EXGSSN: Fortran Interface

```
SUBROUTINE EXGSSN (IDEXO, IDESS, INCNT, LTNESS, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER IDESS (R)

The side set ID.

INCNT(*) (W)

Returned array containing the number of nodes for each side (face in 3-d, edge in 2-d) in the side set.

INTEGER LTNESS(*) (W)

Returned array containing a list of nodes on the side set. Internal node IDs are used in this list (see Node Number Map).

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For an example of code to read a side set node list from an EXODUS II file, refer to the description for `EXGSP`.

5.2.41 Write Concatenated Side Sets

The function `ex_put_concat_side_sets` (or `EXPCSS` for Fortran) writes the side set IDs, side set element count array, side set distribution factor count array, side set element pointers array, side set distribution factors pointers array, side set element list, side set side list, and side set distribution factors. “Concatenated side sets” refers to the arrays needed to define all of the side sets (ID array, side counts array, node counts array, element pointer array, node pointer array, element list, node list, and distribution factors array) as described in Con. Writing concatenated side sets is more efficient than writing individual side sets. See Appendix A for a discussion of efficiency issues.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

It is possible to use this call to only *define* the side sets on the database and to *write* the side set data using other API functions. This usage is also more efficient than defining individual side sets, but is sometimes easier than defining and writing all side set data at one time. To only define the side sets on the database, pass a NULL for the `side_sets_elem_index`, `side_sets_dist_index`, `side_sets_elem_list`, `side_sets_side_list`, and `side_sets_dist_fact` arguments.

In case of an error, `ex_put_concat_side_sets` returns a negative number; a warning will return a positive number. `EXPCSS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the number of side sets specified in a call to `ex_put_init` (`EXPINI` for Fortran) was zero or has been exceeded.
- a side set with the same ID has already been stored.

ex_put_concat_side_sets: C Interface

```
int ex_put_concat_side_sets (exoid, side_sets_ids, num_side_per_set,
                             num_dist_per_set, side_sets_elem_index, side_sets_dist_index,
                             side_sets_elem_list, side_sets_side_list, side_sets_dist_fact);
```

`int exoid (R)`
 EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int* side_sets_ids (R)`
 Array containing the side set ID for each set.

`int* num_side_per_set (R)`
 Array containing the number of sides for each set.

`int* num_dist_per_set (R)`
 Array containing the number of distribution factors for each set.

`int* side_sets_elem_index (R)`
 Array containing the indices into the `side_sets_elem_list` which are the locations of the first element for each set. These indices are 0-based. Pass NULL if only defining side sets with this call.

`int* side_sets_dist_index (R)`
 Array containing the indices into the `side_sets_dist_fact` which are the locations of the first distribution factor for each set. These indices are 0-based. Pass NULL if only defining side sets with this call.

`int* side_sets_elem_list (R)`
 Array containing the elements for all side sets. Internal element IDs are used in this list (see Node Number Map). Pass NULL if only defining side sets with this call.

`int* side_sets_side_list (R)`
 Array containing the sides for all side sets. Pass NULL if only defining side sets with this call.

`void* side_sets_dist_fact (R)`
 Array containing the distribution factors for all side sets. Pass NULL if only defining side sets with this call.

The following coding will write out two side sets in a concatenated format:

```
int error, exoid, ids[2], num_side_per_set[2], elem_ind[2],
    num_df_per_set[2], df_ind[2], elem_list[4], side_list[4];
float dist_fact[8];

/* write concatenated side sets */
ids[0] = 30;
ids[1] = 31;

num_side_per_set[0] = 2;
num_side_per_set[1] = 2;

elem_ind[0] = 0;
elem_ind[1] = 2;

num_df_per_set[0] = 4;
num_df_per_set[1] = 4;

df_ind[0] = 0;
df_ind[1] = 4;
```

```

/* side set #1 */
elem_list[0] = 2; elem_list[1] = 2;
side_list[0] = 2; side_list[1] = 1;
dist_fact[0] = 30.0; dist_fact[1] = 30.1;
dist_fact[2] = 30.2; dist_fact[3] = 30.3;

/* side set #2 */
elem_list[2] = 1; elem_list[3] = 2;
side_list[2] = 4; side_list[3] = 3;
dist_fact[4] = 31.0; dist_fact[5] = 31.1;
dist_fact[6] = 31.2; dist_fact[7] = 31.3;

error = ex_put_concat_side_sets (exoid, ids, num_side_per_set,
    num_df_per_set, elem_ind, df_ind, elem_list, side_list, dist_fact);

```

EXPCSS: Fortran Interface

```

SUBROUTINE EXPCSS (IDEXO, IDESSS, NSESS, NDESS, IXEESS, IXDESS, LTEESS,
    LTSESS, FACESS, IERR)

```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDESSS (*) (R)
Array containing the side set ID for each set.

INTEGER NSESS (*) (R)
Array containing the number of sides for each set.

INTEGER NDESS (*) (R)
Array containing the number of distribution factors for each set.

INTEGER IXEESS (*) (R)
Array containing the indices into the LTEESS array which are the locations of the first element for each set. These indices are 1-based.

INTEGER IXDESS (*) (R)
Array containing the indices into the FACESS array which are the locations of the first distribution factor for each set. These indices are 1-based.

INTEGER LTEESS (*) (R)
Array containing the elements for all side sets. Internal element IDs are used in this list (see Node Number Map).

INTEGER LTSESS (*) (R)
Array containing the sides for all side sets.

REAL FACESS (*) (R)
Array containing the distribution factors for all side sets.

INTEGER IERR (R)
Returned error code. If no errors occurred, 0 is returned.

The following coding will write out two side sets in a concatenated format:

```

    integer ids(2), num_side_per_set(2), num_df_per_set(2),
1   elem_ind(2), df_ind(2), elem_list(4), side_list(4)
    real dist_fact(8)
c
c write concatenated side sets
c

    ids(1) = 30
    ids(2) = 31

    num_side_per_set(1) = 2
    num_side_per_set(2) = 2

    num_df_per_set(1) = 4
    num_df_per_set(2) = 4

    elem_ind(1) = 1
    elem_ind(2) = 3

    df_ind(1) = 1
    df_ind(2) = 5
c
c side set #1 (ID of 30)
c
    elem_list(1) = 11
    elem_list(2) = 12

    side_list(1) = 1
    side_list(2) = 2

    dist_fact(1) = 30.0
    dist_fact(2) = 30.1
    dist_fact(3) = 30.2
    dist_fact(4) = 30.3
c
c side set #2 (ID of 31)
c
    elem_list(3) = 13
    elem_list(4) = 14

    side_list(3) = 3
    side_list(4) = 4

    dist_fact(5) = 31.0
    dist_fact(6) = 31.1
    dist_fact(7) = 31.2
    dist_fact(8) = 31.3

    call expcss (idexo, ids, num_side_per_set, num_df_per_set,
1   elem_ind, df_ind, elem_list, side_list, dist_fact, ierr)

```

5.2.42 Read Concatenated Side Sets

The function `ex_get_concat_side_sets` (or `EXGCSS` for Fortran) reads the side set IDs, side set element count array, side set distribution factors count array, side set element pointers array, side set distribution factors pointers array, side set element list, side set side list, and side set distribution factors. “Concatenated side sets” refers to the arrays needed to define all of the side sets (ID array, side counts array, node counts array, element pointer array, node pointer array, element list, node list, and distribution factors array) as described in Con.

Because the distribution factors are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

The length of each of the returned arrays can be determined by invoking `ex_inquire` (or `EXINQ` for Fortran). See Inquire EXODUS Parameters.

In case of an error, `ex_get_concat_side_sets` returns a negative number; a warning will return a positive number. `EXGCSS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if no side sets are stored in the file.

ex_get_concat_side_sets: C Interface

```
int ex_get_concat_side_sets (exoid, side_set_ids, num_side_per_set,
                             num_dist_per_set, side_sets_elem_index, side_sets_dist_index,
                             side_sets_elem_list, side_sets_side_list, side_sets_dist_fact);
```

`int exoid (R)`

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int* side_set_ids (W)`

Returned array containing the side set ID for each set.

`int* num_side_per_set (W)`

Returned array containing the number of sides for each set.

`int* num_dist_per_set (W)`

Returned array containing the number of distribution factors for each set.

`int* side_sets_elem_index (W)`

Returned array containing the indices into the `side_sets_elem_list` which are the locations of the first element for each set. These indices are 0-based.

`int* side_sets_dist_index (W)`

Returned array containing the indices into the `side_sets_dist_fact` array which are the locations of the first distribution factor for each set. These indices are 0-based.

int* side_sets_elem_list (W)

Returned array containing the elements for all side sets. Internal element IDs are used in this list (see Node Number Map).

int* side_sets_side_list (W)

Returned array containing the sides for all side sets.

void* side_sets_dist_fact (W)

Returned array containing the distribution factors for all side sets.

The following code segment will return in concatenated format all the side sets stored in an EXODUS II file:

```
#include "exodusII.h"
int error, exoid, num_ss, elem_list_len, df_list_len, *ids, *side_list,
    *num_side_per_set, *num_df_per_set, *elem_ind, *df_ind, *elem_list;
float *dist_fact;

error = ex_inquire (exoid, EX_INQ_SIDE_SETS, &num_ss, &fdum, cdum);
if (num_ss > 0) {
    error = ex_inquire(exoid, EX_INQ_SS_ELEM_LEN, &elem_list_len, &fdum,
        cdum);

    error = ex_inquire(exoid, EX_INQ_SS_DF_LEN, &df_list_len, &fdum,
        cdum);

/* read concatenated side sets */

    ids = (int *) calloc(num_ss, sizeof(int));
    num_side_per_set = (int *) calloc(num_ss, sizeof(int));
    num_df_per_set = (int *) calloc(num_ss, sizeof(int));
    elem_ind = (int *) calloc(num_ss, sizeof(int));
    df_ind = (int *) calloc(num_ss, sizeof(int));
    elem_list = (int *) calloc(elem_list_len, sizeof(int));
    side_list = (int *) calloc(elem_list_len, sizeof(int));
    dist_fact = (float *) calloc(df_list_len, sizeof(float));

    error = ex_get_concat_side_sets (exoid, ids, num_side_per_set,
        num_df_per_set, elem_ind, df_ind, elem_list, side_list, dist_fact);
}
```

EXGCSS: Fortran Interface

SUBROUTINE EXGCSS (IDEXO, IDESSS, NSESS, NDESS, IXEESS, IXDESS, LTEESS,
LTSESS, FACESS, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IDESSS(*) (W)

Returned array containing the side set ID for each set.

INTEGER NSESS(*) (W)

Returned array containing the number of sides for each set.

INTEGER NDESS(*) (W)

Returned array containing the number of distribution factors for each set.

INTEGER IXEESS(*) (W)

Returned array containing the indices into the LTEESS array which are the locations of the first element for each set. These indices are 1-based.

INTEGER IXDESS(*) (W)

Returned array containing the indices into the FACESS array which are the locations of the first distribution factor for each set. These indices are 1-based.

INTEGER LTEESS(*) (W)

Returned array containing the elements for all side sets. Internal element IDs are used in this list (see Node Number Map).

INTEGER LTSESS(*) (W)

Returned array containing the sides for all side sets.

REAL FACESS(*) (W)

Returned array containing the distribution factors for all side sets.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will return in concatenated format all the side sets stored in an EXODUS II file:

```
c NOTE: MAXSS is the maximum number of side sets
c       MAXSID is the maximum number of sides in a side set
c       MAXDF is the max number of distribution factors in a side set

      integer elemlen, nodelen, dflen, ids(MAXSS), num_side(MAXSS),
1      num_df(MAXSS), elem_ind(MAXSS), df_ind(MAXSS),
2      elem_list(MAXSID*MAXSS), side_list(MAXSID*MAXSS)
      real dist_fact(MAXDF*MAXSS)

      call exinq (idexo, EXSIDS, num_side_sets, fdum, cdum, ierr)

      if (num_side_sets .gt. 0) then
c
c use the following inquiries if dynamic allocation is available
      call exinq (idexo, EXSSEL, elemlen, fdum, cdum, ierr)
      call exinq (idexo, EXSSNL, nodelen, fdum, cdum, ierr)
      call exinq (idexo, EXSSDF, dflen, fdum, cdum, ierr)
c
c read concatenated side sets
      call exgcss (idexo, ids, num_side, num_df, elem_ind, df_ind,
        elem_list, side_list, dist_fact, ierr)
      endif
```

5.2.43 Convert Side Set Nodes to Sides

The function `ex_cvt_nodes_to_sides` (or `EXCN2S` for Fortran) is used to convert a side set node list to a side set side list. This routine is provided for application programs that utilize side sets defined by nodes (as was done previous to release 2.0) rather than local faces or edges. The

application program must allocate memory for the returned array of sides. The length of this array is the same as the length of the concatenated side sets element list, which can be determined with a call to `ex_inquire` (or `EXINQ` for Fortran).

In case of an error, `ex_cvt_nodes_to_sides` returns a negative number; a warning will return a positive number. `EXCN2S` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- a warning value is returned if no side sets are stored in the file.
- because the faces of a wedge require a different number of nodes to describe them (quadrilateral vs. triangular faces), the function will abort with a fatal return code if a wedge is encountered in the side set element list.

ex_cvt_nodes_to_sides: C Interface

```
int ex_cvt_nodes_to_sides (exoid, num_side_per_set, num_nodes_per_set,
    side_sets_elem_index, side_sets_node_index, side_sets_elem_list,
    side_sets_node_list, side_sets_side_list);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int* num_side_per_set (R)

Array containing the number of sides for each set. The number of sides is equal to the number of elements for each set.

int* num_nodes_per_set (R)

Array containing the number of nodes for each set.

int* side_sets_elem_index (R)

Array containing indices into the `side_sets_elem_list` which are the locations of the first element for each set. These indices are 0-based.

int* side_sets_node_index (R)

Array containing indices into the `side_sets_node_list` which are the locations of the first node for each set. These indices are 0-based.

int* side_sets_elem_list (R)

Array containing the elements for all side sets. Internal element IDs are used in this list (see Node Number Map).

int* side_sets_node_list (R)

Array containing the nodes for all side sets. Internal node IDs are used in this list (see Node Number Map).

int* side_sets_side_list (W)

Returned array containing the sides for all side sets.

The following code segment will convert side sets described by nodes to side sets described by local side numbers:

```
int error, exoid, ids[2], num_side_per_set[2], num_nodes_per_set[2],
    elem_ind[2], node_ind[2], elem_list[4], node_list[8], el_1st_len,
```

```

    *side_list;

ids[0] = 30; ids[1] = 31;

num_side_per_set[0] = 2; num_side_per_set[1] = 2;
num_nodes_per_set[0] = 4; num_nodes_per_set[1] = 4;
elem_ind[0] = 0; elem_ind[1] = 2;
node_ind[0] = 0; node_ind[1] = 4;

/* side set #1 */
elem_list[0] = 2; elem_list[1] = 2;
node_list[0] = 8; node_list[1] = 5; node_list[2] = 6; node_list[3] = 7;

/* side set #2 */
elem_list[2] = 1; elem_list[3] = 2;
node_list[4] = 2; node_list[5] = 3; node_list[6] = 7; node_list[7] = 8;

error = ex_inquire (exoid, EX_INQ_SS_ELEM_LEN, &el_lst_len, &fdum,cdum);

/* side set element list is same length as side list */
side_list = (int *) calloc (el_lst_len, sizeof(int));

ex_cvt_nodes_to_sides(exoid, num_side_per_set, num_nodes_per_set,
    elem_ind, node_ind, elem_list, node_list, side_list);

```

EXCN2S: Fortran Interface

```

SUBROUTINE EXCN2S(IDEXO, NSESS, NDESS, IXEESS, IXNESS, LTEESS, LTNESS,
    LTSESS, IERR)
INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.
INTEGER NSESS(*) (R)
    Array containing the number of sides for each set. The number of sides is equal to the
    number of elements for each set.
INTEGER NDESS(*) (R)
    Array containing the number of nodes for each set.
INTEGER IXEESS(*) (R)
    Array containing indices into the LTEESS array which are the locations of the first element
    for each set. These indices are 1-based.
INTEGER IXNESS(*) (R)
    Array containing indices into the LTNESS array which are the locations of the first node for
    each set. These indices are 1-based.
INTEGER LTEESS(*) (R)
    Array containing the elements for all side sets. Internal element IDs are used in this list (see
    Node Number Map).
INTEGER LTNESS(*) (R)
    Array containing the nodes for all side sets. Internal node IDs are used in this list (see Node

```

Number Map).

INTEGER LTSESS(*) (W)

Returned array containing the sides for all side sets.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will convert side sets described by nodes to side sets described by local side numbers:

```
INCLUDE 'exodusII.inc'
integer ids(2), num_side_per_set(2), num_nodes_per_set(2),
1 elem_ind(2), node_ind(2), node_list(8), elem_list(4),
2 side_list(4)

ids(1) = 30
ids(2) = 31
num_side_per_set(1) = 2
num_side_per_set(2) = 2
num_nodes_per_set(1) = 4
num_nodes_per_set(2) = 4
elem_ind(1) = 1
elem_ind(2) = 3
node_ind(1) = 1
node_ind(2) = 5
c
c side set #1
node_list(1) = 8
node_list(2) = 5
node_list(3) = 6
node_list(4) = 7
elem_list(1) = 2
elem_list(2) = 2
c
c side set #2
node_list(5) = 2
node_list(6) = 3
node_list(7) = 7
node_list(8) = 8
elem_list(3) = 1
elem_list(4) = 2
call excn2s(idexo, num_side_per_set, num_nodes_per_set, elem_ind,
1 node_ind, elem_list, node_list, side_list, ierr)
```

5.2.44 Write Coordinate Frames

Coordinate frames are stored in the database as a series of three points (defined in the basic cartesian coordinate system). The first of these points describes the origin of the new system. The second point lies on the 3 axis (or Z axis) of the frame. The third point is in the 1-3 (xz) plane. Each coordinate frame is identified by a unique, integer coordinate ID, and by a character tag indicating whether the frame is rectangular cartesian "R", cylindrical "C", or spherical "S".

Because the coordinates are floating point values, the application code must declare the arrays passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

The function `ex_put_coordinate_frames()` writes out the optional coordinate frames to the database. The function `ex_put_init` must be invoked before this call is made.

In case of an error, a negative number is returned. Possible causes of error include:

- data file not properly opened with call to `ex_create`
- data file opened for read only
- data file not properly initialized with call to `ex_put_init`
- coordinate frames have already been defined in this file.
- Coordinate tags are unrecognized, i.e. they are not “r”, “c” or “s”.

ex_put_coordinate_frames: C Interface

```
int ex_put_coordinate_frames(exoid, nframes, cf_ids, pt_coordinates, tags);
```

```
int exoid
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

```
int nframes
```

The number of coordinate frames to write

```
const int cf_ids[]
```

The (nframes) coordinate frame Ids. Integers greater than 0.

```
const void* pt_coordinates
```

The (9*nframes) coordinates of the three points defining each coordinate axis. The first three values are the origin of the first frame. The next three values are the coordinates of a point on the 3rd axis of the first frame. The next three values are the coordinates of a point in the plane of the 1-3 axis. The pattern is repeated for each frame.

```
const char* tags
```

The (nframes) character tags associated with each coordinate frame.

The following sample code generates two coordinate frames and stores them in the database. The first frame (id=20), is a rectangular system with an origin at (1,0,0) and is parallel to the basic coordinate system. The second frame is a cylindrical system with an origin at (0,0,0), a cylindrical axis in the <1,0,0> direction and with the “1” axis in the <0,1,0> direction

```
int cf_ids[2]={20, 13};
double pt_coords[9*2]={1, 0, 0, 1,0,1, 2,0,0,
                      0, 0, 0, 1,0,0, 0,1,0 };
char tags[2]={'r', 'c'};
ex_put_coordinate_frames(exoid,2, cf_ids,pt_coords,tags);
```

5.2.45 Read Coordinate Frames

Coordinate frames are stored in the database as a series of three points (defined in the basic cartesian coordinate system). The first of these points describes the origin of the new system. The second point lies on the 3 axis (or Z axis) of the frame. The third point is in the 1-3 (xz) plane. Each coordinate frame is identified by a unique, integer coordinate ID, and by a character tag indicating whether the frame is rectangular cartesian “R”, cylindrical “C”, or spherical “S”.

Because the coordinates are floating point values, the application code must declare the arrays passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

The function `ex_get_coordinate_frames()` reads the optional coordinate frames from the database.

In case of an error, a negative number is returned. Possible causes of error include:

- data file not properly opened with call to `ex_create` or `ex_open`.
- coordinate frames are undefined in this file (returns +1)

ex_get_coordinate_frames: C Interface

```
int ex_get_coordinate_frames(exoid, nframes, cf_ids, pt_coordinates, tags);
```

```
int exoid
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

```
int &nframes
```

The number of coordinate frames to read

```
const int cf_ids[]
```

The (`nframes`) coordinate frame IDs. If `cf_ids` is NULL, no data will be returned in this or any other array. Only `nframes` will be modified. Otherwise, space must be allocated to store “`nframes`” integers before making this call.

```
const void* pt_coordinates
```

The ($9 \times nframes$) coordinates of the three points defining each coordinate axis. The first three values are the origin of the first frame. The next three values are the coordinates of a point on the 3rd axis of the first frame. The next three values are the coordinates of a point in the plane of the 1-3 axis. The pattern is repeated for each frame. If “`cf_ids`” is null, no data will be returned in this array. Otherwise, space must be allocated for $9 \times nframes$ floating point values. The size of the allocation depends upon the compute word size.

```
const char* tags
```

The (`nframes`) character tags associated with each coordinate frame. If “`cf_ids`” is null, no data will be returned in this array. Otherwise, space must be allocated for “`nframes`”

characters.

The following sample code reads coordinate frames from the database.

```
int nframes, err, *cf_ids;
double *pt_coords;
char *tags;
err = ex_get_coordinate_frames(exoid, &nframes, 0, 0, 0);

cf_ids = malloc(nframes * sizeof(int));
pt_coords = malloc(9 * nframes * sizeof(double));
tags = malloc(nframes);
err = ex_get_coordinate_frames(exoid, &nframes,
cf_ids, pt_coords, tags);
```

5.2.46 Write Object Names

The function `ex_put_names` or (`EXPNAMS` for Fortran) writes the names of the specified object types to the database. The function `ex_put_init` (`EXPINI` for Fortran) must be invoked before this call is made.

In case of an error, `ex_put_names` returns a negative number; a warning will return a positive number. `EXPNAMS` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).

ex_put_names: C Interface

```
int ex_put_names (exoid, obj_type, names);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_type (R)

Type of object; use one of the following options:

- `EX_ELEM_BLOCK`
- `EX_NODE_SET`
- `EX_SIDE_SET`
- `EX_ELEM_MAP`
- `EX_NODE_MAP`

- To designate an element block.
- To designate a node set.
- To designate a side set.
- To designate an element map.
- To designate a node map.

char** names (R)

Array containing the names (of length `MAX_STR_LENGTH`) of the specified object types. The

length of the array will equal the number of that type of entity on the database.

EXPNAMS: Fortran Interface

```
SUBROUTINE EXPNAMS (IDEXO, ITYPE, NAME, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ITYPE (R)
Type of object; use one of the following options:

- EXEBLK •To designate an element block.
- EXNSET •To designate a node set.
- EXSSET •To designate a side set.
- EXNMAP •To designate a node map.
- EXEMAP •To designate an element map.

CHARACTER*MXSTLN NAME(*) (R)
Array containing the names for the specified object type.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

5.2.47 Read Object Names

The function `ex_get_names` or (`EXGNAMS` for Fortran) reads the names (`MAX_STR_LENGTH`-characters in length) of the specified object arrays from the database. Memory must be allocated for the character strings before this function is invoked.

In case of an error, `ex_get_names` returns a negative number; a warning will return a positive number. `EXGNAMS` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if coordinate names were not stored.

ex_get_names: C Interface

```
int ex_get_names (exoid, obj_type, coord_names);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_typ (R)
Type of object; use one of the following options:

- EX_ELEM_BLOCK •To designate an element block.
- EX_NODE_SET •To designate a node set.
- EX_SIDE_SET •To designate a side set.
- EX_ELEM_MAP •To designate an element map.
- EX_NODE_MAP •To designate a node map.

char** names (W)

Returned pointer to a vector containing the names of the specified objects.

EXGNAMS: Fortran Interface

```
SUBROUTINE EXGNAMS (IDEXO, ITYPE, NAMES, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

```
INTEGER ITYPE (R)
```

Type of object; use one of the following options:

- EXEBLK •To designate an element block.
- EXNSET •To designate a node set.
- EXSSET •To designate a side set.
- EXNMAP •To designate a node map.
- EXEMAP •To designate an element map

```
CHARACTER*MXSTLN NAMES (*) (W)
```

Returned array containing the names for the specified object type.

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

5.2.48 Write Individual Object Name

The function `ex_put_name` or (`EXPNAM` for Fortran) writes the name of the object with the specified id of the specified type to the database. The function `ex_put_init` (`EXPINI` for Fortran) must be invoked before this call is made.

In case of an error, `ex_put_name` returns a negative number; a warning will return a positive number. `EXPNAM` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).

ex_put_name: C Interface

```
int ex_put_name (exoid, obj_type, id, name);
```

```
int exoid (R)
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

```
int obj_typ (R)
```

Type of object; use one of the following options:

- EX_ELEM_BLOCK •To designate an element block.
- EX_NODE_SET •To designate a node set.
- EX_SIDE_SET •To designate a side set.
- EX_ELEM_MAP •To designate an element map.
- EX_NODE_MAP •To designate a node map.

```
int id
```

The object (element block, nodeset, or sideset) id.

```
char* name (R)
```

The name (of length `MAX_STR_LENGTH`) of the specified object.

EXPNAME: Fortran Interface

```
SUBROUTINE EXPNAME (IDEXO, ITYPE, ID, NAME, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

```
INTEGER ITYPE (R)
```

Type of object; use one of the following options:

- EXEBLK •To designate an element block.
- EXNSET •To designate a node set.
- EXSSET •To designate a side set.
- EXNMAP •To designate a node map.
- EXEMAP •To designate an element map.

```
INTEGER ID
```

The object (element block, nodeset, or sideset) id.

```
CHARACTER*MXSTLN NAME (R)
```

The name for the specified object.

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

5.2.49 Read Individual Object Name

The function `ex_get_name` or (`EXGNAM` for Fortran) reads the name (`MAX_STR_LENGTH`-characters in length) of the object of the specified type with the specified id

from the database. Memory must be allocated for the character string before this function is invoked.

In case of an error, `ex_get_name` returns a negative number; a warning will return a positive number. `EXGNAM` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- a warning value is returned if coordinate names were not stored.

ex_get_name: C Interface

```
int ex_get_name (exoid, obj_type, id, name);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_typ (R)

Type of object; use one of the following options:

- | | |
|----------------|---------------------------------|
| •EX_ELEM_BLOCK | •To designate an element block. |
| •EX_NODE_SET | •To designate a node set. |
| •EX_SIDE_SET | •To designate a side set. |
| •EX_ELEM_MAP | •To designate an element map. |
| •EX_NODE_MAP | •To designate a node map. |

int id

The object (element block, nodeset, sideset, node map, or element map) id.

char* name (W)

Returned pointer to the name of the specified objects.

EXGNAM: Fortran Interface

```
SUBROUTINE EXGNAM (IDEXO, ITYPE, ID, NAME, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER ITYPE (R)

Type of object; use one of the following options:

- | | |
|--------|--------------------------------|
| EXEBLK | To designate an element block. |
| EXNSET | To designate a node set. |
| EXSSET | To designate a side set. |
| EXNMAP | To designate a node map. |
| EXEMAP | To designate an element map. |

INTEGER ID

The object (element block, nodeset, sideset) id

CHARACTER*MXSTLN NAME (W)

Returned name for the specified object.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

5.2.50 Write Property Arrays Names

The function `ex_put_prop_names` (or `EXPPN` for Fortran) writes property names and allocates space for property arrays used to assign integer properties to element blocks, node sets, or side sets. The property arrays are initialized to zero (0). Although this function is optional, since `ex_put_prop` will allocate space within the data file if it hasn't been previously allocated, it is more efficient to use `ex_put_prop_names` if there is more than one property to store. See Appendix A for a discussion of efficiency issues.

In case of an error, `ex_put_prop_names` returns a negative number; a warning will return a positive number. `EXPPN` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid object type specified.
- no object of the specified type is stored in the file.

ex_put_prop_names: C Interface

```
int ex_put_prop_names (exoid, obj_type, num_props, prop_names);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_typ (R)

Type of object; use one of the following options:

`EX_ELEM_BLOCK` To designate an element block.

`EX_NODE_SET` To designate a node set.

`EX_SIDE_SET` To designate a side set.

`EX_ELEM_MAP` To designate an element map.

`EX_NODE_MAP` To designate a node map.

int num_props (R)

The number of integer properties to be assigned to all of the objects of the type specified

(element blocks, node sets, or side sets).

char** prop_names (R)

Array containing num_props names (of maximum length of MAX_STR_LENGTH) of properties to be stored.

For instance, suppose a user wanted to assign the 1st, 3rd, and 5th element blocks (those element blocks stored 1st, 3rd, and 5th, regardless of their ID) to a group (property) called “TOP”, and the 2nd, 3rd, and 4th element blocks to a group called “LSIDE”. This could be accomplished with the following code:

```
#include "exodusII.h";
char* prop_names[2];
int top_part[] = {1,0,1,0,1};
int lside_part[] = {0,1,1,1,0};
int id[] = {10, 20, 30, 40, 50};
prop_names[0] = "TOP";
prop_names[1] = "LSIDE";
/* This call to ex_put_prop_names is optional, but more efficient */
ex_put_prop_names (exoid, EX_ELEM_BLOCK, 2, prop_names);

/* The property values can be output individually thus */
for (i=0; i<5; i++){
    ex_put_prop (exoid, EX_ELEM_BLOCK, id[i], prop_names[0], top_part[i]);
    ex_put_prop (exoid, EX_ELEM_BLOCK, id[i], prop_names[1],
    lside_part[i]); }

/* Alternatively, the values can be output as an array thus*/
ex_put_prop_array (exoid, EX_ELEM_BLOCK, prop_names[0], top_part);
ex_put_prop_array (exoid, EX_ELEM_BLOCK, prop_names[1], lside_part);
```

EXPPN: Fortran Interface

SUBROUTINE EXPPN (IDEXO, ITYPE, NPROPS, NAMEPR, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ITYPE (R)

Type of object; use one of the following options:

EXEBLK	To designate an element block.
EXNSET	To designate a node set.
EXSSET	To designate a side set.
EXNMAP	To designate a node map.
EXEMAP	To designate an element map.

INTEGER NPROPS (R)

The number of integer properties to be assigned to all of the objects of the type specified (element blocks, node sets, or side sets).

CHARACTER*MXSTLN NAMEPR(*) (R)

Array containing NPROPS names of properties to be stored.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following example assigns a property “STEEL” to the first and third element blocks with ID’s 10 and 30, respectively.

```
include 'exodusII.inc'
integer ival(3)
data ival/1,0,1/
C This call to EXPPN is optional, but more efficient
call expnp (idexo, exeblk, 1, "STEEL", ierr)

C The property values can be written individually thus
call exp (idexo, EXEBLK, 10, "STEEL", 1, ierr)
call exp (idexo, EXEBLK, 30, "STEEL", 1, ierr)
C Alternatively, the values can be written as an array thus
call expa (idexo, EXEBLK, "STEEL", ival, ierr)
```

5.2.51 Read Property Arrays Names

The function `ex_get_prop_names` (or `EXGPN` for Fortran) returns names of integer properties stored for an element block, node set, or side set. The number of properties (needed to allocate space for the property names) can be obtained via a call to `ex_get_num_props` or `ex_inquire` (`EXINQ` for Fortran). See Inquire EXODUS Parameters.

In case of an error, `ex_get_prop_names` returns a negative number; a warning will return a positive number. `EXGPN` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid object type specified.

ex_get_prop_names: C Interface

```
int ex_get_prop_names (exoid, obj_type, prop_names);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_type (R)
Type of object; use one of the following options:

<code>EX_ELEM_BLOCK</code>	To designate an element block.
<code>EX_NODE_SET</code>	To designate a node set.
<code>EX_SIDE_SET</code>	To designate a side set.
<code>EX_ELEM_MAP</code>	To designate an element map.
<code>EX_NODE_MAP</code>	To designate a node map.

char** prop_names (W)

Returned array containing num_props (obtained from call to ex_inquire or ex_get_num_props) names (of maximum length MAX_STR_LENGTH) of properties to be stored. "ID", a reserved property name, will be the first name in the array.

As an example, the following code segment reads in properties assigned to node sets:

```
#include "exodusII.h";
int error, exoid, num_props, *prop_values;
char *prop_names[MAX_PROPS];

/* read node set properties */
error = ex_inquire (exoid, EX_INQ_NS_PROP, &num_props, &fdum, cdum);

for (i=0; i<num_props; i++){
    prop_names[i] = (char *) malloc ((MAX_STR_LENGTH+1), sizeof(char));
    prop_values = (int *) malloc (num_node_sets, sizeof(int));

error = ex_get_prop_names(exoid, EX_NODE_SET, prop_names);
for (i=0; i<num_props; i++){
    error = ex_get_prop_array(exoid, EX_NODE_SET, prop_names[i],
prop_values);
```

EXGPN: Fortran Interface

SUBROUTINE EXGPN (IDEXO, ITYPE, NAMEPR, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ITYPE (R)

Type of object; use one of the following options:

EXEBLK	To designate an element block.
EXNSET	To designate a node set.
EXSSET	To designate a side set.
EXNMAP	To designate a node map.
EXEMAP	To designate an element map.

CHARACTER*MXSTLN NAMEPR(*) (W)

Returned array containing NPROPS (obtained from call to EXINQ) names of properties to be stored. "ID", a reserved property name, will be the first name in the array.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

As an example, the following will read the side set property values from an EXODUS II file:

```
c NOTE:                                MAXSS is the maximum number of side
sets
```

```

c      MXSSPR is the maximum number of side set properties

      include 'exodusII.inc'
      integer ids(MAXSS), ivals(MAXSS, MXSSPR)
      character*(MXSTLN) prop_names(MXSSPR)

c determine number of side sets and side set properties
      call exinq (idexo, EXSIDS, num_side_sets, fdum, cdum, ierr)
      call exinq (idexo, EXNSSP, num_props, fdum, cdum, ierr)

c get the side set property names
      call exgpn(idexo, EXSSET, prop_names, ierr)

c get the side set ids
      call exgssi (idexo, ids, ierr)

c get the side set property values individually
      do 20 i = 1, num_props
        do 10 j = 1, num_side_sets
          call exgp(idexo, EXSSET,ids(j),prop_names(i),ivals(j,i),ierr)
10          continue
20 continue

c alternatively, the property values can be read in together as follows
      do 30 i = 1, num_props
        call exgpa (idexo, EXSSET, prop_names(i), ivals(1,i), ierr)
30      continue

```

5.2.52 Write Object Property

The function `ex_put_prop` (or `EXPP` for Fortran) stores an integer property value to a single element block, node set, or side set. Although it is not necessary to invoke `ex_put_prop_names` (`EXPPN` for Fortran), since `ex_put_prop` will allocate space within the data file if it hasn't been previously allocated, it is more efficient to use `ex_put_prop_names` if there is more than one property to store. See Appendix A for a discussion of efficiency issues.

It should be noted that the interpretation of the values of the integers stored as properties is left to the application code. In general, a zero (0) means the object does not have the specified property (or is not in the specified group); a nonzero value means the object does have the specified property. When space is allocated for the properties using `ex_put_prop_names` or `ex_put_prop`, the properties are initialized to zero (0).

Because the ID of an element block, node set, or side set is just another property (named "ID"), this routine can be used to change the value of an ID. This feature must be used with caution, though, because changing the ID of an object to the ID of another object of the same type (element block, node set, or side set) would cause two objects to have the same ID, and thus only the first would be accessible. Therefore, `ex_put_prop` issues a warning if a user attempts to give two objects the same ID.

In case of an error, `ex_put_prop` returns a negative number; a warning will return a positive number. `EXPP` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid object type specified.
- a warning is issued if a user attempts to change the ID of an object to the ID of an existing object of the same type.

ex_put_prop: C Interface

```
int ex_put_prop (exoid, obj_type, obj_id, prop_name, value);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int obj_type (R)`
Type of object; use one of the following options:

<code>EX_ELEM_BLOCK</code>	To designate an element block.
<code>EX_NODE_SET</code>	To designate a node set.
<code>EX_SIDE_SET</code>	To designate a side set.
<code>EX_ELEM_MAP</code>	To designate an element map.
<code>EX_NODE_MAP</code>	To designate a node map.

`int obj_id (R)`
The element block, node set, or side set ID.

`char* prop_name (R)`
The name of the property for which the value will be stored. Maximum length of this string is `MAX_STR_LENGTH`.

`int value (R)`
The value of the property.

For an example of code to write out an object property, refer to the description for `ex_put_prop_names`.

EXPP: Fortran Interface

```
SUBROUTINE EXPP (IDEXO, ITYPE, ID, NAMEPR, IVAL, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`INTEGER ITYPE (R)`
Type of object; use one of the following options:

EXEBLK	To designate an element block.
EXNSET	To designate a node set.
EXSSET	To designate a side set.
EXNMAP	To designate a node map.
EXEMAP	To designate an element map.

INTEGER ID (R)

The element block, node set, or side set ID.

CHARACTER*MXSTLN NAMEPR (R)

The name of the property for which a value will be stored.

INTEGER IVAL (R)

The value of the property.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For an example of code to write out an object property, refer to the description for EXPPN.

5.2.53 Read Object Property

The function `ex_get_prop` (or `EXGP` for Fortran) reads an integer property value stored for a single element block, node set, or side set.

In case of an error, `ex_get_prop` returns a negative number; a warning will return a positive number. `EXGP` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid object type specified.
- a warning value is returned if a property with the specified name is not found.

ex_get_prop: C Interface

```
int ex_get_prop (exoid, obj_type, obj_id, prop_name, value);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_type (R)

Type of object; use one of the following options:

EX_ELEM_BLOCK	To designate an element block.
EX_NODE_SET	To designate a node set.
EX_SIDE_SET	To designate a side set.
EX_ELEM_MAP	To designate an element map.
EX_NODE_MAP	To designate a node map.

int obj_id (R)

The element block, node set, or side set ID.

char* prop_name (R)

The name of the property (maximum length is MAX_STR_LENGTH) for which the value is desired.

int* value (W)

Returned value of the property.

For an example of code to read an object property, refer to the description for `ex_get_prop_names`.

EXGP: Fortran Interface

```
SUBROUTINE EXGP (IDEXO, ITYPE, ID, NAMEPR, IVAL, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER ITYPE (R)

Type of object; use one of the following options:

EXEBLK	To designate an element block.
EXNSET	To designate a node set.
EXSSET	To designate a side set.
EXNMAP	To designate a node map.
EXEMAP	To designate an element map.

INTEGER ID (R)

The element block, node set, or side set ID.

CHARACTER*MXSTLN NAMEPR (R)

The name of the property for which the value is desired.

INTEGER IVAL (W)

Returned value of the property.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For an example of code to read an object property, refer to the description for `EXGPN`.

5.2.54 Write Object Property Array

The function `ex_put_prop_array` (or `EXPPA` for Fortran) stores an array of (`num_elem_blk`, `num_node_sets`, or `num_side_sets`) integer property values for all element blocks, node sets, or side sets. The order of the values in the array must correspond to the order in which the element blocks, node sets, or side sets were introduced into the file. For instance, if the parameters for element block with ID 20 were written to a file (via `ex_put_elem_block`; or

EXPELB for Fortran), and then parameters for element block with ID 10, followed by the parameters for element block with ID 30, the first, second, and third elements in the property array would correspond to element block 20, element block 10, and element block 30, respectively.

One should note that this same functionality (writing properties to multiple objects) can be accomplished with multiple calls to `ex_put_prop` (or `EXPP` in Fortran).

Although it is not necessary to invoke `ex_put_prop_names` (`EXPPN` for Fortran), since `ex_put_prop_array` will allocate space within the data file if it hasn't been previously allocated, it is more efficient to use `ex_put_prop_names` if there is more than one property to store. See Appendix A for a discussion of efficiency issues.

In case of an error, `ex_put_prop_array` returns a negative number; a warning will return a positive number. `EXPPA` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid object type specified.

ex_put_prop_array: C Interface

```
int ex_put_prop_array (exoid, obj_type, prop_name, values);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int obj_type (R)`
Type of object; use one of the following options:

<code>EX_ELEM_BLOCK</code>	To designate an element block.
<code>EX_NODE_SET</code>	To designate a node set.
<code>EX_SIDE_SET</code>	To designate a side set.
<code>EX_ELEM_MAP</code>	To designate an element map.
<code>EX_NODE_MAP</code>	To designate a node map.

`char* prop_name (R)`
The name of the property for which the values will be stored. Maximum length of this string is `MAX_STR_LENGTH`.

`int* values (R)`
An array of property values.

For an example of code to write an array of object properties, refer to the description for `ex_put_prop_names`.

EXPPA: Fortran Interface

SUBROUTINE EXPPA (IDEXO, ITYPE, NAMEPR, IVALS, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ITYPE (R)

Type of object; use one of the following options:

EXEBLK	To designate an element block.
EXNSET	To designate a node set.
EXSSET	To designate a side set.
EXNMAP	To designate a node map.
EXEMAP	To designate an element map.

CHARACTER*MXSTLN NAMEPR (R)

The name of the property for which the values will be stored.

INTEGER IVAL(*) (R)

An array of property values.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For an example of code to write an array of object properties, refer to the description for EXPPN.

5.2.55 Read Object Property Array

The function `ex_get_prop_array` (or `EXGPA` for Fortran) reads an array of integer property values for all element blocks, node sets, or side sets. The order of the values in the array correspond to the order in which the element blocks, node sets, or side sets were introduced into the file. Before this function is invoked, memory must be allocated for the returned array of (`num_elem_blk`, `num_node_sets`, or `num_side_sets`) integer values.

This function can be used in place of `ex_get_elem_blk_ids` (`EXGEBI` for Fortran), `ex_get_node_set_ids` (`EXGNSI` for Fortran), and `ex_get_side_set_ids` (`EXGSSI` for Fortran) to get element block, node set, and side set IDs, respectively, by requesting the property name “ID.” One should also note that this same function can be accomplished with multiple calls to `ex_get_prop` (or `EXGP` in Fortran).

In case of an error, `ex_get_prop_array` returns a negative number; a warning will return a positive number. `EXGPA` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid object type specified.
- a warning value is returned if a property with the specified name is not found.

ex_get_prop_array: C Interface

```
int ex_get_prop_array (exoid, obj_type, prop_name, values);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_type
Type of object; use one of the following options:

EX_ELEM_BLOCK	To designate an element block.
EX_NODE_SET	To designate a node set.
EX_SIDE_SET	To designate a side set.
EX_ELEM_MAP	To designate an element map.
EX_NODE_MAP	To designate a node map.

char* prop_name (R)
The name of the property (maximum length of `MAX_STR_LENGTH`) for which the values are desired.

int* values (W)
Returned array of property values.

For an example of code to read an array of object properties, refer to the description for `ex_get_prop_names`.

EXGPA: Fortran Interface

```
SUBROUTINE EXGPA (IDEXO, ITYPE, NAMEPR, IVALS, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER ITYPE (R)
Type of object; use one of the following options:

EXEBLK	To designate an element block.
EXNSET	To designate a node set.
EXSSET	To designate a side set.
EXNMAP	To designate a node map.
EXEMAP	To designate an element map.

CHARACTER*MXSTLN NAMEPR (R)
The name of the property for which the values are desired.

INTEGER IVAL(*) (W)
Returned array of property values.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

For an example of code to read an array of object properties, refer to the description for `EXGPN`.

5.2.56 Get Number of Object Properties

The function `ex_get_num_props` returns the number of properties of the specified type that are defined on the database. This function can be used in place of `ex_inquire`

The function will return 0 if there are no objects of the specified type or if there is an error.

ex_get_num_props: C Interface

```
int ex_get_num_props (exoid, obj_type);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int obj_type
Type of object; use one of the following options:

<code>EX_ELEM_BLOCK</code>	To designate an element block.
<code>EX_NODE_SET</code>	To designate a node set.
<code>EX_SIDE_SET</code>	To designate a side set.
<code>EX_ELEM_MAP</code>	To designate an element map.
<code>EX_NODE_MAP</code>	To designate a node map.

5.2.57 Copy One Database to Another

The function `ex_copy` can be used to efficiently copy the “Model Description” portion of one EXODUS II database to another EXODUS II database. The function will copy all data defined in the input database to the output database **except**:

- Results data (see Results Data) which includes all results variables (global, elemental, nodeset, sideset, and nodal); variable truth tables (element, nodeset, and sideset), and simulation times.
- QA Records (see Write Q).
- Information Records (see Write Information Records).
- Any variable which has been defined in the output file prior to calling `ex_copy`. This gives you the ability to modify the model definition slightly prior to copying; however, unrestrained use of this capability can result in a corrupt model definition in the output database. If you are going to modify the output model, it is probably safer to not use `ex_copy` and instead use the normal API for model output.

The `ex_copy` function will only return an error if the `EX_LARGE_MODEL` setting of the input and output databases does not match.

ex_copy: C Interface

```
int ex_copy (in_exoid, out_exoid);
```

```
int in_exoid (R)
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`. This is the file ID of the file which will be copied from.

```
int out_exoid
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`. This is the file ID of the file which will be written.

EXCOPY: Fortran Interface

```
SUBROUTINE EXCOPY (IN_IDEXO, OUT_IDEXO)
```

```
INTEGER IN_IDEXO (R)
```

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`. This is the file ID of the file which will be copied from

```
INTEGER OUT_IDEXO (R)
```

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`. This is the file ID of the file which will be written

5.3 Results Data

This section describes functions which read and write analysis results data and related entities. These include results variables (global, elemental, nodeset, sideset, and nodal); variable truth tables (element, nodeset, and sideset), and simulation times.

5.3.1 Write Results Variables Parameters

The function `ex_put_var_param` (or `EXPVP` for Fortran) writes the number of global, nodal, nodeset, sideset, or element variables that will be written to the database.

In case of an error, `ex_put_var_param` returns a negative number; a warning will return a positive number. `EXPVP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- invalid variable type specified (must be one of “gGnNeEmMsS”).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- this routine has already been called with the same variable type; redefining the number

- of variables is not allowed.
- a warning value is returned if the number of variables is specified as zero.

ex_put_var_param: C Interface

```
int ex_put_var_param (exoid, var_type, num_vars);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* var_type (R)
Character indicating the type of variable which is described. Use one of the following options:

"g" (or "G")	For global variables.
"n" (or "N")	For nodal variables.
"e" (or "E")	For element variables.
"m" (or "M")	For nodeset variables.
"s" (or "S")	For sideset variables.

int num_vars (R)
The number of `var_type` variables that will be written to the database.

For example, the following code segment initializes the data file to store global variables:

```
int num_glo_vars, error, exoid;

/* write results variables parameters */

num_glo_vars = 3;
error = ex_put_var_param (exoid, "g", num_glo_vars);
```

EXPVP: Fortran Interface

```
SUBROUTINE EXPVP (IDEXO, VARTYP, NVAR, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

CHARACTER*1 VARTYP (R)
Character indicating the type of variable which is described. Use one of the following options:

"g" (or "G")	For global variables.
"n" (or "N")	For nodal variables.
"e" (or "E")	For element variables.
"m" (or "M")	For nodeset variables.
"s" (or "S")	For sideset variables.

INTEGER NVAR (R)

The number of VARTYP variables that will be written to the database.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For example, the following code segment initializes the data file to store global variables:

```
num_glo_vars = 1
call expvp (idexo, "g", num_glo_vars, ierr)
```

5.3.2 Read Results Variables Parameters

The function `ex_get_var_param` (or `EXGVP` for Fortran) reads the number of global, nodal, nodeset, sideset, or element variables stored in the database.

In case of an error, `ex_get_var_param` returns a negative number; a warning will return a positive number. `EXGVP` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid variable type specified (must be one of "gGnNeEmMsS").

`ex_get_var_param`: C Interface

```
int ex_get_var_param (exoid, var_type, num_vars);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* var_type (R)

Character indicating the type of variable which is described. Use one of the following options:

"g" (or "G")	For global variables.
"n" (or "N")	For nodal variables.
"e" (or "E")	For element variables.
"m" (or "M")	For nodeset variables.
"s" (or "S")	For sideset variables.

int* num_vars (W)

Returned number of `var_type` variables that are stored in the database.

As an example, the following coding will determine the number of global variables stored in the data file:

```
int num_glo_vars, error, exoid;

/* read global variables parameters */
```

```
error = ex_get_var_param (exoid, "g", &num_glo_vars);
```

EXGVP: Fortran Interface

SUBROUTINE EXGVP (IDEXO, VARTYP, NVAR, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

CHARACTER*1 VARTYP (R)

Character indicating the type of variable which is described. Use one of the following options:

"g" (or "G")	For global variables.
"n" (or "N")	For nodal variables.
"e" (or "E")	For element variables.
"m" (or "M")	For nodeset variables.
"s" (or "S")	For sideset variables.

INTEGER NVAR (W)

Returned number of VARTYP variables that are stored in the database.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

As an example, the following coding will determine the number of global variables stored in the data file:

```
call exgvp (idexo, "g", num_glo_vars, ierr)
```

5.3.3 Write All Results Variables Parameters

The function `ex_put_all_var_param` defines in one call the number of global, nodal, nodeset, sideset, and element variables that will be written to the database. Using this function is more efficient than calling `ex_put_var_param` for global, nodal, element, nodeset, and sideset result variables followed by a call to put the element, nodeset, and sideset variable truth tables. See Appendix A for a more in-depth description of exodusII efficiency concerns.

In case of an error, `ex_put_all_var_param` returns a negative number; a warning will return a positive number. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (EXCRE or EXOPEN for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init`.
- this routine has already been called; redefining the number of variables is not allowed.
- a warning value is returned if the number of variables is specified as zero.

ex_put_all_var_param: C Interface

```
int ex_put_all_var_param (exoid,num_g, num_n, num_e, elem_var_tab, num_m,
                        nset_var_tab, num_s, sset_var_tab),
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int num_g (R)
The number of global variables that will be written to the database.

int num_n (R)
The number of nodal variables that will be written to the database.

int num_e (R)
The number of element variables that will be written to the database.

```
int elem_var_tab[num_elem_blk,num_elem_var] (R)
```

A 2-dimensional array (with the `num_elem_var` index cycling faster) containing the element variable truth table.

int num_m (R)
The number of nodeset variables that will be written to the database.

```
int nset_var_tab[num_nset,num_nset_var] (R)
```

A 2-dimensional array (with the `num_nset_var` index cycling faster) containing the nodeset variable truth table.

int num_s (R)
The number of sideset variables that will be written to the database.

```
int sset_var_tab[num_sset,num_sset_var] (R)
```

A 2-dimensional array (with the `num_sset_var` index cycling faster) containing the sideset variable truth table.

5.3.4 Write Results Variables Names

The function `ex_put_var_names` or (`EXPVAN` for Fortran) writes the names of the results variables to the database. The names are `MAX_STR_LENGTH`-characters in length. The function `ex_put_var_param` (`EXPVP` for Fortran) must be called before this function is invoked.

In case of an error, `ex_put_var_names` returns a negative number; a warning will return a positive number. `EXPVAN` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid variable type specified (must be one of “gGnNeEmMs”).
- `ex_put_var_param` (`EXPVP` for Fortran) was not called previously or was called with

zero variables of the specified type.

- `ex_put_var_names` or (`EXPVAN` for Fortran) has been called previously for the specified variable type.

ex_put_var_names: C Interface

```
int ex_put_var_names (exoid, var_type, num_vars, var_names[]);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`char* var_type (R)`
Character indicating the type of variable which is described. Use one of the following options:

"g" (or "G")	For global variables.
"n" (or "N")	For nodal variables.
"e" (or "E")	For element variables.
"m" (or "M")	For nodeset variables.
"s" (or "S")	For sideset variables.

`int num_vars (R)`
The number of `var_type` variables that will be written to the database.

`char** var_names (R)`
Array of pointers to `num_vars` variable names.

The following coding will write out the names associated with the nodal variables:

```
int num_nod_vars, error, exoid;
char *var_names[2];

/* write results variables parameters and names */

num_nod_vars = 2;

var_names[0] = "disx";
var_names[1] = "disy";

error = ex_put_var_param (exoid, "n", num_nod_vars);
error = ex_put_var_names (exoid, "n", num_nod_vars, var_names);
```

EXPVAN: Fortran Interface

```
SUBROUTINE EXPVAN (IDEXO, VARTYP, NVAR, NAMES, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`CHARACTER*1 VARTYP (R)`
Character indicating the type of variable which is described. Use one of the following

options:

“g” (or “G”)	For global variables.
“n” (or “N”)	For nodal variables.
“e” (or “E”)	For element variables.
“m” (or “M”)	For nodeset variables.
“s” (or “S”)	For sideset variables.

INTEGER NVAR (R)

The number of VARTYP variables that will be written to the database.

CHARACTER*MXSTLN NAMES (*)

Array containing NVAR variable names.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following coding will write out the names associated with the nodal variables:

```
include 'exodusII.inc'
character*(MXSTLN) var_names(1)

var_names(1) = "glo_vars"
call expvan (idexo, "g", num_glo_vars, var_names, ierr)
```

5.3.5 Read Results Variables Names

The function `ex_get_var_names` or (`EXGVAN` for Fortran) reads the names of the results variables from the database. Memory must be allocated for the name array before this function is invoked. The names are `MAX_STR_LENGTH`-characters in length.

In case of an error, `ex_get_var_names` returns a negative number; a warning will return a positive number. `EXGVAN` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- invalid variable type specified (must be one of “gGnNeEmMsS”).
- a warning value is returned if no variables of the specified type are stored in the file.

ex_get_var_names: C Interface

```
int ex_get_var_names (exoid, var_type, num_vars, var_names[]);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* var_type

Character indicating the type of variable which is described. Use one of the following options:

“g” (or “G”)	For global variables.
“n” (or “N”)	For nodal variables.
“e” (or “E”)	For element variables.
“m” (or “M”)	For nodeset variables.
“s” (or “S”)	For sideset variables.

int num_vars (R)

The number of var_type variables that will be read from the database.

char** var_names (W)

Returned array of pointers to num_vars variable names.

As an example, the following code segment will read the names of the nodal variables stored in the data file:

```
#include "exodusII.h"
int error, exoid, num_nod_vars;
char *var_names[10];

/* read nodal variables parameters and names */

error = ex_get_var_param (exoid, "n", &num_nod_vars);

for (i=0; i<num_nod_vars; i++)
    var_names[i] = (char *) calloc ((MAX_STR_LENGTH+1), sizeof(char));
error = ex_get_var_names (exoid, "n", num_nod_vars, var_names);
```

EXGVAN: Fortran Interface

SUBROUTINE EXGVAN (IDEXO, VARTYP, NVAR, NAMES, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

CHARACTER*1 VARTYP (R)

Character indicating the type of variable which is described. Use one of the following options:

“g” (or “G”)	For global variables.
“n” (or “N”)	For nodal variables.
“e” (or “E”)	For element variables.
“m” (or “M”)	For nodeset variables.
“s” (or “S”)	For sideset variables.

INTEGER NVAR (R)

The number of VARTYP variables that will be read from the database.

CHARACTER*MXSTLN NAMES (*) (W)

Returned array containing NVAR (returned from a call to EXGVP) variable names.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

As an example, the following code segment will read the names of the global variables stored in the data file:

```
c NOTE:                                     MAXVARS is the maximum number of global
    variables
c
    include 'exodusII.inc'
    character*(MXSTLN) var_names(MAXVARS)
c
c read global variables parameters and names
c
    call exgvp (idexo, "g", num_glo_vars, ierr)

    call exgvn (idexo, "g", num_glo_vars, var_names, ierr)
```

5.3.6 Write Individual Results Variable Name

The function `ex_put_var_name` writes the name of the specified results variable to the database. The name is `MAX_STR_LENGTH`-characters in length. The function `ex_put_var_param` (`EXPVP` for Fortran) must be called before this function is invoked.

In case of an error, `ex_put_var_name` returns a negative number; a warning will return a positive number. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid variable type specified (must be one of "gGnNeEmMsS").
- `ex_put_var_param` (`EXPVP` for Fortran) was not called previously or was called with zero variables of the specified type.
- `ex_put_var_name` or (`EXPVAN` for Fortran) has been called previously for the specified variable.

ex_put_var_name: C Interface

```
int ex_put_var_name (exoid, var_type, index, var_name);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* var_type (R)
Character indicating the type of variable which is described. Use one of the following options:

"g" (or "G")	For global variables.
"n" (or "N")	For nodal variables.
"e" (or "E")	For element variables.
"m" (or "M")	For nodeset variables.

“s” (or “S”) For sideset variables.

int index (R)
The index of the var_type variable name that will be written to the database. Valid values are 1 up to the number of variables on the database.

char* var_name (R)
Pointer to variable name.

5.3.7 Read Individual Results Variable Name

The function `ex_get_var_name` reads the name of the specified results variable from the database. Memory must be allocated for the name before this function is invoked. The name is MAX_STR_LENGTH-characters in length.

In case of an error, `ex_get_var_name` returns a negative number; a warning will return a positive number. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (EXCRE or EXOPEN for Fortran).
- invalid variable type specified (must be one of “gGnNeEmMsS”).
- variable index is out of valid range which is 1 up to number of variables of the specified type.
- a warning value is returned if no variables of the specified type are stored in the file.

ex_get_var_name: C Interface

```
int ex_get_var_name (exoid, var_type, index, var_name);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* var_type
Character indicating the type of variable which is described. Use one of the following options:

“g” (or “G”)	For global variables.
“n” (or “N”)	For nodal variables.
“e” (or “E”)	For element variables.
“m” (or “M”)	For nodeset variables.
“s” (or “S”)	For sideset variables.

int index(R)
The index of the variable whose name is to be read. Valid range is 1 up to number of var_type variables on the database.

char* var_name (W)
Returned pointer to variable name.

5.3.8 Write Time Value for a Time Step

The function `ex_put_time` (or `EXPTIM` for Fortran) writes the time value for a specified time step.

Because time values are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_time` returns a negative number; a warning will return a positive number. `EXPTIM` returns a nonzero error (negative) or warning (positive) number in `IERR`.

Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.

ex_put_time: C Interface

```
int ex_put_time (exoid, time_step, time_value);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int time_step (R)`
The time step number. This is essentially a counter that is incremented only when results variables are output to the data file. The first time step is 1.

`void* time_value (R)`
The time at the specified time step.

The following code segment will write out the simulation time value at simulation time step n:

```
int error, exoid, n;  
float time_value;  
  
/* write time value */  
  
error = ex_put_time (exoid, n, &time_value);
```

EXPTIM: Fortran Interface

```
SUBROUTINE EXPTIM (IDEXO, NSTEP, TIME, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER NSTEP (R)

The time step number. This essentially a counter that is incremented only when results variables are output to the data file. The first time step is 1.

REAL TIME (R)

The time at the specified time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following code segment will write out the simulation time value at simulation time step n:

```
c
c write time value to file
c

    call exptim (idexo, n, time_value, ierr)
```

5.3.9 Read Time Value for a Time Step

The function `ex_get_time` (or `EXGTIM` for Fortran) reads the time value for a specified time step.

Because time values are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_time` returns a negative number; a warning will return a positive number. `EXGTIM` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- no time steps have been stored in the file.

ex_get_time: C Interface

```
int ex_get_time (exoid, time_step, time_value);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number. This is essentially an index (in the time dimension) into the global, nodal, and element variables arrays stored in the database. The first time step is 1.

void* time_value (W)

Returned time at the specified time step.

As an example, the following coding will read the time value stored in the data file for time step n :

```
int n, error, exoid;
float time_value;

/* read time value at time step 3 */

n = 3;
error = ex_get_time (exoid, n, &time_value);
```

EXGTIM: Fortran Interface

```
SUBROUTINE EXGTIM (IDEXO, NSTEP, TIME, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER NSTEP (R)
The time step number. This is essentially an index (in the time dimension) into the global, nodal, and element variables arrays stored in the database. The first time step is 1.

REAL TIME (W)
Returned time at the specified time step.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

As an example, the following coding will read the time value stored in the data file for time step n :

```
c
c read time value at time step 3
c
  n = 3
  call exgtim (idexo, n, time_value, ierr)
```

5.3.10 Read All Time Values

The function `ex_get_all_times` (or EXGATM for Fortran) reads the time values for all time steps. Memory must be allocated for the time values array before this function is invoked. The storage requirements (equal to the number of time steps) can be determined by using the `ex_inquire` (or EXINQ in Fortran) routine. See Inquire EXODUS Parameters.

Because time values are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or EXCRE for Fortran) or `ex_open` (or EXOPEN for Fortran).

In case of an error, `ex_get_all_times` returns a negative number; a warning will return a positive number. `EXGATM` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- no time steps have been stored in the file.

ex_get_all_times: C Interface

```
int ex_get_all_times (exoid, time_values);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`void* time_values (W)`
Returned array of times. These are the time values at all time steps.

The following code segment will read the time values for all time steps stored in the data file:

```
#include "exodusII.h"

int error, exoid, num_time_steps;
float *time_values;

/* determine how many time steps are stored */

error = ex_inquire (exoid, EX_INQ_TIME, &num_time_steps,
                  &fdum, cdum);

/* read time values at all time steps */

time_values = (float *) calloc (num_time_steps, sizeof(float));

error = ex_get_all_times (exoid, time_values);
```

EXGATM: Fortran Interface

```
SUBROUTINE EXGATM (IDEXO, TIME, IERR)
```

`INTEGER IDEXO (R)`
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

`REAL TIME(*) (W)`
Returned array of times. These are the time values at all time steps.

`INTEGER IERR (W)`
Returned error code. If no errors occurred, 0 is returned.

The following code segment will read the time values for all time steps stored in the data file:

```

c NOTE:      MAXTIM is the maximum number of time steps
c
c      include 'exodusII.inc'
c
c      real time_values(MAXTIM)
c
c determine how many time steps are stored; this can be used if dynamic
c memory allocation is available
c
c      call exinq (idexo, EXTIMS, num_time_steps, fdum, cdum, ierr)
c
c read time values at all time steps
c
c      call exgatm (idexo, time_values, ierr)

```

5.3.11 Write Object Variable Truth Table

The function `ex_put_var_tab` (or `EXPVTT` for Fortran) writes the EXODUS II variable truth table for the specified object type (element block, nodeset, or sideset) to the database. The variable truth table indicates whether a particular object result is written for the objects in a particular entity block. A 0 (zero) entry indicates that no results will be output for that variable for that block. A non-zero entry indicates that the appropriate results will be output.

Although writing the variable truth tables is optional, it is encouraged because it creates at one time all the necessary netCDF variables in which to hold the EXODUS variable values of the specified type. This results in significant time savings. See Appendix A for a discussion of efficiency issues.

The function `ex_put_var_param` (or `EXPVP` for Fortran) must be called before this routine in order to define the number of variables for the specified object type.

In case of an error, `ex_put_var_tab` returns a negative number; a warning will return a positive number. `EXPVTT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the specified number of objects is different than the number specified in a call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_elem_block`, `ex_put_nset`, or `ex_put_sset` not called to specify element block parameters.
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously to specify the number of variables or was called but with a different number of variables.

- `ex_put_elem_var` previously called.

ex_put_var_tab: C Interface

```
int ex_put_var_tab (exoid, var_type, num_blk, num_var, var_tab);
```

`int exoid (R)`
 EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`char* var_type (R)`
 Character indicating the type of truth table which is being written. Use one of the following options:

“e” (or “E”)	For element variables.
“m” (or “M”)	For nodeset variables.
“s” (or “S”)	For sideset variables.

`int num_blk (R)`
 The number of blocks.

`int num_var (R)`
 The number of variables.

`int var_tab[num_blk,num_var] (R)`
 A 2-dimensional array (with the `num_var` index cycling faster) containing the variable truth table.

5.3.12 Read Variable Truth Table

The function `ex_get_var_tab` reads the EXODUS II variable truth table from the database. For a description of the truth table, see the usage of the function `ex_put_var_tab`. Memory must be allocated for the truth table (`num_blk * num_var` in length) before this function is invoked. If the truth table is not stored in the file, it will be created based on information in the file and then returned.

In case of an error, `ex_get_elem_var_tab` returns a negative number; a warning will return a positive number. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the specified number of blocks is different than the number specified in a call to `ex_put_init` (`EXPINI` for Fortran).
- there are no variables stored in the file or the specified number of variables doesn't match the number specified in a call to `ex_put_var_param`.

ex_get_var_tab: C Interface

```
int ex_get_var_tab (exoid, var_type, num_elem_blk, num_elem_var,  
                    elem_var_tab);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

char* var_type (R)

Character indicating the type of truth table which is being written. Use one of the following options:

"e" (or "E")	For element variables.
"m" (or "M")	For nodeset variables.
"s" (or "S")	For sideset variables.

int num_blk (R)

The number of blocks.

int num_var (R)

The number of variables.

int var_tab[num_blk,num_var] (W)

Returned 2-dimensional array (with the `num_var` index cycling faster) containing the variable truth table.

5.3.13 Write Element Variable Truth Table

The function `ex_put_elem_var_tab` (or `EXPVTT` for Fortran) writes the EXODUS II element variable truth table to the database. The element variable truth table indicates whether a particular element result is written for the elements in a particular element block. A 0 (zero) entry indicates that no results will be output for that element variable for that element block. A non-zero entry indicates that the appropriate results will be output.

Although writing the element variable truth table is optional, it is encouraged because it creates at one time all the necessary netCDF variables in which to hold the EXODUS element variable values. This results in significant time savings. See Appendix A for a discussion of efficiency issues. Calling the function `ex_put_var_tab` with an object type of "E" results in the same behavior as calling this function.

The function `ex_put_var_param` (or `EXPVP` for Fortran) must be called before this routine in order to define the number of element variables.

In case of an error, `ex_put_elem_var_tab` returns a negative number; a warning will return a positive number. `EXPVTT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.

- data file not initialized properly with call to `ex_put_init` (EXPINI for Fortran).
- the specified number of element blocks is different than the number specified in a call to `ex_put_init` (EXPINI for Fortran).
- `ex_put_elem_block` (or EXPELB for Fortran) not called previously to specify element block parameters.
- `ex_put_var_param` (or EXPVP for Fortran) not called previously to specify the number of element variables or was called but with a different number of element variables.
- `ex_put_elem_var` previously called.

ex_put_elem_var_tab: C Interface

```
int ex_put_elem_var_tab (exoid, num_elem_blk, num_elem_var, elem_var_tab);
```

`int exoid` (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int num_elem_blk` (R)
The number of element blocks.

`int num_elem_var` (R)
The number of element variables.

`int elem_var_tab[num_elem_blk,num_elem_var]` (R)
A 2-dimensional array (with the `num_elem_var` index cycling faster) containing the element variable truth table.

The following coding will create, populate, and write an element variable truth table to an opened EXODUS II file (NOTE: all element variables are valid for all element blocks in this example.):

```
int *truth_tab, num_elem_blk, num_ele_vars, error, exoid;

/* write element variable truth table */
truth_tab = (int *) calloc ((num_elem_blk*num_ele_vars), sizeof(int));

for (i=0, k=0; i<num_elem_blk; i++)
    for (j=0; j<num_ele_vars; j++)
        truth_tab[k++] = 1;

error = ex_put_elem_var_tab (exoid, num_elem_blk, num_ele_vars,
                             truth_tab);
```

EXPVTT: Fortran Interface

```
SUBROUTINE EXPVTT (IDEXO, NELBLK, NVAREL, ISEVOK, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER NELBLK (R)

The number of element blocks.

INTEGER NVAREL (R)

The number of element variables.

INTEGER ISEVOK(NVAREL,NELBLK) (R)

A 2-dimensional array (with the NVAREL index cycling faster) containing the element variable truth table.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following coding will create, populate, and write an element variable truth table to an opened EXODUS II file. (NOTE: all element variables are valid for all element blocks in this example.):

```
integer truth_tab(num_ele_vars,num_elem_blk)
c
c write element variable truth table
icnt = 0
do 30 i = 1,num_elem_blk
  do 20 j = 1,num_ele_vars
    truth_tab(j,i) = 1
20    continue
30    continue
call expvtt (idexo, num_elem_blk, num_ele_vars, truth_tab, ierr)
```

5.3.14 Read Element Variable Truth Table

The function `ex_get_elem_var_tab` (or `EXGVTT` for Fortran) reads the EXODUS II element variable truth table from the database. For a description of the truth table, see the usage of the function `ex_put_elem_var_tab`. Memory must be allocated for the truth table (`num_elem_blk * num_elem_var` in length) before this function is invoked. If the truth table is not stored in the file, it will be created based on information in the file and then returned. Calling the function `ex_get_var_tab` with an object type of “E” results in the same behavior as calling this function

In case of an error, `ex_get_elem_var_tab` returns a negative number; a warning will return a positive number. `EXGVTT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the specified number of element blocks is different than the number specified in a call to `ex_put_init` (`EXPINI` for Fortran).
- there are no element variables stored in the file or the specified number of element variables doesn't match the number specified in a call to `ex_put_var_param` (or `EXPVP` for Fortran).

ex_get_elem_var_tab: C Interface

```
int ex_get_elem_var_tab (exoid, num_elem_blk, num_elem_var, elem_var_tab);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int num_elem_blk (R)
The number of element blocks.

int num_elem_var (R)
The number of element variables.

int elem_var_tab[num_elem_blk,num_elem_var] (W)
Returned 2-dimensional array (with the `num_elem_var` index cycling faster) containing the element variable truth table.

As an example, the following coding will read the element variable truth table from an opened EXODUS II file:

```
int *truth_tab, num_elem_blk, num_ele_vars, error, exoid;  
truth_tab = (int *) calloc ((num_elem_blk*num_ele_vars), sizeof(int));  
  
error = ex_get_elem_var_tab (exoid, num_elem_blk, num_ele_vars,  
                             truth_tab);
```

EXGVTT: Fortran Interface

```
SUBROUTINE EXGVTT (IDEXO, NELBLK, NVAREL, ISEVOK, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER NELBLK (R)
The number of element blocks.

INTEGER NVAREL (R)
The number of element variables.

INTEGER ISEVOK(NVAREL, NELBLK) (W)
Returned 2-dimensional array (with the `NVAREL` index cycling faster) containing the element variable truth table.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

As an example, the following coding will read the element variable truth table from an opened EXODUS II file:

```
integer truth_tab(num_ele_vars,num_elem_blk)  
c  
c read element variable truth table  
c  
call exgvtt (idexo, num_elem_blk, num_ele_vars, truth_tab, ierr)
```

5.3.15 Write Element Variable Values at a Time Step

The function `ex_put_elem_var` (or `EXPEV` for Fortran) writes the values of a single element variable for one element block at one time step. It is recommended, but not required, to write the element variable truth table (with `ex_put_elem_var_tab` for C; `EXPVTT` for Fortran) before this function is invoked for better efficiency. See Appendix A for a discussion of efficiency issues.

Because element variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_elem_var` returns a negative number; a warning will return a positive number. `EXPEV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid element block ID.
- `ex_put_elem_block` (or `EXPELB` for Fortran) not called previously to specify parameters for this element block.
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously specifying the number of element variables.
- an element variable truth table was stored in the file but contains a zero (indicating no valid element variable) for the specified element block and element variable.

ex_put_elem_var: C Interface

```
int ex_put_elem_var (exoid, time_step, elem_var_index, elem_blk_id,  
                    num_elem_this_blk, elem_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number, as described under `ex_put_time`. This is essentially a counter that is incremented only when results variables are output. The first time step is 1.

int elem_var_index (R)

The index of the element variable. The first variable has an index of 1.

int elem_blk_id (R)

The element block ID.

int num_elem_this_blk (R)

The number of elements in the given element block.

void* elem_var_vals (R)

Array of num_elem_this_blk values of the elem_var_indexth element variable for the element block with ID of elem_blk_id at the time_stepth time step.

The following coding will write out all of the element variables for a single time step n to an open EXODUS II file:

```
int num_ele_vars, num_elem_blk, *num_elem_in_block,error, exoid, n,
    *ebids;
float *elem_var_vals;

/* write element variables */

for (k=1; k<=num_ele_vars; k++)
{
    for (j=0; j<num_elem_blk; j++)
    {
        elem_var_vals = (float *)
            calloc (num_elem_in_block[j], sizeof(float));

        for (m=0; m<num_elem_in_block[j]; m++)
        {
            /* simulation code fills this in */
            elem_var_vals[m] = 10.0;
        }
        error = ex_put_elem_var (exoid, n, k, ebids[j],
            num_elem_in_block[j], elem_var_vals);
        free (elem_var_vals);
    }
}
```

EXPEV: Fortran Interface

SUBROUTINE EXPEV (IDEXO, ISTEP, IXELEV, IDELB, NUMELB, VALEV, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ISTEP (R)

The time step number, as described under EXPTIM. This is essentially a counter that is incremented only when results variables are output. The first time step is 1.

INTEGER IXELEV (R)

The index of the element variable. The first variable has an index of 1.

INTEGER IDELB (R)

The element block ID.

INTEGER NUMELB (R)

The number of elements in the given element block.

REAL VALEV(*) (R)

Array of NUMELB values of the IXELEVth element variable for the element block with ID of

IDELB at the ISTEPth time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following coding will write out all of the element variables for a single time step n to an open EXODUS II file:

```
c NOTE: MAXEBK is maximum number of element blocks
c       MAXELB is maximum number of elements per block
c
c       integer num_elem_in_block(MAXEBK)
c       real elem_var_vals(MAXELB)
c
c write element variables
c
c       do 100 k = 1, num_ele_vars
c         do 90 j = 1, num_elem_blk
c           do 80 m = 1, num_elem_in_block(j)
c analysis code fills this array
c           elem_var_vals(m) = 10.0
80          continue
c
c           call expev (idexo, n, k, num_elem_in_block(j),
c             1          elem_var_vals, ierr)
90        continue
100       continue
```

5.3.16 Read Element Variable Values at a Time Step

The function `ex_get_elem_var` (or `EXGEV` for Fortran) reads the values of a single element variable for one element block at one time step. Memory must be allocated for the element variable values array before this function is invoked.

Because element variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_elem_var` returns a negative number; a warning will return a positive number. `EXGEV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- variable does not exist for the desired element block.
- invalid element block.

ex_get_elem_var: C Interface

```
int ex_get_elem_var (exoid, time_step, elem_var_index, elem_blk_id,  
                    num_elem_this_blk, elem_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number, as described under `ex_put_time`, at which the element variable values are desired. This is essentially an index (in the time dimension) into the element variable values array stored in the database. The first time step is 1.

int elem_var_index (R)

The index of the desired element variable. The first variable has an index of 1.

int elem_blk_id (R)

The desired element block ID.

int num_elem_this_blk (R)

The number of elements in this element block.

void* elem_var_vals (W)

Returned array of `num_elem_this_blk` values of the `elem_var_index`th element variable for the element block with ID of `elem_blk_id` at the `time_step`th time step.

As an example, the following code segment will read the `var_index`th element variable at one time step stored in an EXODUS II file:

```
int *ids, num_elem_blk, error, exoid, *num_elem_in_block, step, var_ind;  
float *var_vals;  
  
ids = (int *) calloc(num_elem_blk, sizeof(int));  
error = ex_get_elem_blk_ids (exoid, ids);  
  
step = 1; /* read at the first time step */  
for (i=0; i<num_elem_blk; i++) {  
    var_vals = (float *) calloc (num_elem_in_block[i], sizeof(float));  
    error = ex_get_elem_var (exoid, step, var_ind, ids[i],  
                            num_elem_in_block[i], var_vals);  
    free (var_vals); }  
}
```

EXGEV: Fortran Interface

```
SUBROUTINE EXGEV (IDEXO, ISTEP, IXELEV, IDELB, NUMELB, VALEV, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER ISTEP (R)

The time step number, as described under `EXPTIM`, at which the element variable is desired. This is essentially an index (in the time dimension) into the element variable values array stored in the database. The first time step is 1.

INTEGER IXELEV (R)

The index of the desired element variable. The first variable has an index of 1.

INTEGER IDELB (R)

The desired element block ID.

INTEGER NUMELB (R)

The number of elements in this element block.

REAL VALEV(*) (W)

Returned array of NUMELB values of the IXELEVth element variable for the element block with ID of IDELB at the ISTEPth time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

As an example, the following code segment will read the `var_index`th element variable at one time step stored in an EXODUS II file:

```
c NOTE: MAXEBK is maximum number of element blocks
c       MAXELB is maximum number of elements per block
integer ids(MAXEBK), var_index, num_elem_in_block(MAXEBK)
real var_values(MAXELB)

call exgebi (idexo, ids, ierr)

do 10 i = 1, num_elem_blk
    call exgev (idexo, istep, var_index, ids(i),
1          num_elem_in_block(i), var_values, ierr)
10 continue
```

5.3.17 Read Element Variable Values through Time

The function `ex_get_elem_var_time` (or `EXGEVT` for Fortran) reads the values of an element variable for a single element through a specified number of time steps. Memory must be allocated for the element variable values array before this function is invoked.

Because element variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_elem_var_time` returns a negative number; a warning will return a positive number. `EXGEVT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_elem_block` (or `EXPELB` for Fortran) not called previously to specify parameters for all element blocks.

- variable does not exist for the desired element or results haven't been written.

ex_get_elem_var_time: C Interface

```
int ex_get_elem_var_time (exoid, int elem_var_index, int elem_number, int
    beg_time_step, int end_time_step, elem_var_vals);
```

int exoid (R)
EXODUS file ID returned from a previous call to ex_create or ex_open.

int elem_var_index (R)
The index of the desired element variable. The first variable has an index of 1.

int elem_number (R)
The internal ID (see Node Number Map) of the desired element. The first element is 1.

int beg_time_step (R)
The beginning time step for which an element variable value is desired. This is not a time value but rather a time step number, as described under ex_put_time. The first time step is 1.

int end_time_step (R)
The last time step for which an element variable value is desired. If negative, the last time step in the database will be used. The first time step is 1.

void* elem_var_vals (W)
Returned array of (end_time_step - beg_time_step + 1) values of the elem_numberth element for the elem_var_indexth element variable.

For example, the following coding will read the values of the var_indexth element variable for element number 2 from the first time step to the last time step:

```
#include "exodusII.h"

int error, exoid, num_time_steps, var_index, elem_num, beg_time,
    end_time;
float *var_values;

/* determine how many time steps are stored */
error = ex_inquire (exoid, EX_INQ_TIME, &num_time_steps, &fdum, cdum);

/* read an element variable through time */
var_values = (float *) calloc (num_time_steps, sizeof(float));

var_index = 2;
elem_num = 2;
beg_time = 1;
end_time = -1;

error = ex_get_elem_var_time (exoid, var_index, elem_num,
    beg_time, end_time, var_values);
```

EXGEVT: Fortran Interface

SUBROUTINE EXGEVT (IDEXO, IXELEV, IELNUM, ISTEPB, ISTPE, VALEV, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IXELEV (R)

The index of the desired element variable. The first variable has an index of 1.

INTEGER IELNUM (R)

The internal ID (see Node Number Map) of the desired element. The first element is 1.

INTEGER ISTEPB (R)

The beginning time step for which an element variable value is desired. This is not a time value but rather a time step number, as described under EXPTIM. The first time step is 1.

INTEGER ISTPE (R)

The last time step for which an element variable value is desired. If negative, the last time step in the database will be used. The first time step is 1.

REAL VALEV(*) (W)

Returned array of $(ISTPE - ISTEPB + 1)$ values of the $IELNUM$ th element for the $IXELEV$ th element variable.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For example, the following coding will read the values of the var_index th element variable for element number 2 from the first time step to the last time step:

```
c NOTE:      MAXVAL is the maximum number of values to be read
c
c      integer var_index, elem_num, beg_time, end_time
c      real var_values(MAXVAL)
c
c read an element variable through time
c
c      var_index = 2
c      elem_num = 2
c      beg_time = 1
c      end_time = -1
c
c      call exgevt (idexo, var_index, elem_num, beg_time, end_time,
c      1 var_values, ierr)
```

5.3.18 Write Nodeset Variable Truth Table

The function `ex_put_nset_var_tab` (or `EXPVTT` for Fortran) writes the EXODUS II nodeset variable truth table to the database. The nodeset variable truth table indicates whether a particular nodeset result is written for the nodes in a particular nodeset. A 0 (zero) entry

indicates that no results will be output for that nodeset variable for that nodeset. A non-zero entry indicates that the appropriate results will be output.

Although writing the nodeset variable truth table is optional, it is encouraged because it creates at one time all the necessary netCDF variables in which to hold the EXODUS nodeset variable values. This results in significant time savings. See Appendix A for a discussion of efficiency issues. Calling the function `ex_put_var_tab` with an object type of “M” results in the same behavior as calling this function

The function `ex_put_var_param` (or `EXPVP` for Fortran) must be called before this routine in order to define the number of nodeset variables.

In case of an error, `ex_put_nset_var_tab` returns a negative number; a warning will return a positive number. `EXPVTT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the specified number of nodesets is different than the number specified in a call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_node_set` (or `EXPNS` for Fortran) not called previously to specify nodeset parameters.
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously to specify the number of nodeset variables or was called but with a different number of nodeset variables.
- `ex_put_nset_var` previously called.

`ex_put_nset_var_tab`: C Interface

```
int ex_put_nset_var_tab (exoid, num_nsets, num_nset_var, nset_var_tab);
```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int num_nset (R)`
The number of nodesets.

`int num_nset_var (R)`
The number of nodeset variables.

`int nset_var_tab[num_nset,num_nset_var] (R)`
A 2-dimensional array (with the `num_nset_var` index cycling faster) containing the nodeset variable truth table.

EXPNSTT: Fortran Interface

```
SUBROUTINE EXPNSTT (IDEXO, NUMNS NVARNS, ISNSVOK, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

```
INTEGER NUMNS (R)
```

The number of nodesets.

```
INTEGER NVARNS (R)
```

The number of nodeset variables.

```
INTEGER ISNSVOK(NVARNS,NUMNS) (R)
```

A 2-dimensional array (with the NVARNS index cycling faster) containing the nodeset variable truth table.

```
INTEGER IERR (W)
```

Returned error code. If no errors occurred, 0 is returned.

5.3.19 Read Nodeset Variable Truth Table

The function `ex_get_nset_var_tab` (or `EXGNSTT` for Fortran) reads the EXODUS II nodeset variable truth table from the database. For a description of the truth table, see the usage of the function `ex_put_nset_var_tab`. Memory must be allocated for the truth table (`num_sidesets * num_nset_var` in length) before this function is invoked. If the truth table is not stored in the file, it will be created based on information in the file and then returned. Calling the function `ex_put_var_tab` with an object type of “M” results in the same behavior as calling this function

In case of an error, `ex_get_nset_var_tab` returns a negative number; a warning will return a positive number. `EXGNSTT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the specified number of nodesets is different than the number specified in a call to `ex_put_init` (`EXPINI` for Fortran).
- there are no nodeset variables stored in the file or the specified number of nodeset variables doesn't match the number specified in a call to `ex_put_var_param` (or `EXPVP` for Fortran).

ex_get_nset_var_tab: C Interface

```
int ex_get_nset_var_tab (exoid, num_nsets, num_nset_var, nset_var_tab);
```

int exoid (R)
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int num_nsets (R)
The number of nodesets.

int num_nset_var (R)
The number of nodeset variables.

int nset_var_tab[num_nsets,num_nset_var] (W)
Returned 2-dimensional array (with the `num_nset_var` index cycling faster) containing the nodeset variable truth table.

EXGNSTT: Fortran Interface

```
SUBROUTINE EXGNSTT (IDEXO, NNSETS, NVARNS, ISNSVOK, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER NNSETS (R)
The number of nodesets.

INTEGER NVARNS (R)
The number of nodeset variables.

INTEGER ISNSVOK(NVARNS, NNSETS) (W)
Returned 2-dimensional array (with the `NVARNS` index cycling faster) containing the nodeset variable truth table.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

5.3.20 Write Nodeset Variable Values at a Time Step

The function `ex_put_nset_var` (or `EXPNSV` for Fortran) writes the values of a single nodeset variable for one nodeset at one time step. It is recommended, but not required, to write the nodeset variable truth table (with `ex_put_nset_var_tab` for C; `EXPNSTT` for Fortran) before this function is invoked for better efficiency. See Appendix A for a discussion of efficiency issues.

Because nodeset variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_nset_var` returns a negative number; a warning will return a positive number. `EXPNSV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for

Fortran).

- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid nodeset ID.
- `ex_put_node_set` (or `EXPNS` for Fortran) not called previously to specify parameters for this nodeset.
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously specifying the number of nodeset variables.
- a nodeset variable truth table was stored in the file but contains a zero (indicating no valid nodeset variable) for the specified nodeset and nodeset variable.

ex_put_nset_var: C Interface

```
int ex_put_nset_var (exoid, time_step, nset_var_index, nset_id,  
                    num_nodes_this_blk, nset_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number, as described under `ex_put_time`. This is essentially a counter that is incremented only when results variables are output. The first time step is 1.

int nset_var_index (R)

The index of the nodeset variable. The first variable has an index of 1.

int nset_id (R)

The nodeset ID.

int num_nodes_this_blk (R)

The number of nodes in the given nodeset.

void* nset_var_vals (R)

Array of `num_nodes_this_blk` values of the `nset_var_index`th nodeset variable for the nodeset with ID of `nset_id` at the `time_step`th time step.

EXPNSV: Fortran Interface

```
SUBROUTINE EXPNSV (IDEXO, ISTEP, IXNSV, IDNS, NUMNOD, VALNSV, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER ISTEP (R)

The time step number, as described under `EXPTIM`. This is essentially a counter that is incremented only when results variables are output. The first time step is 1.

INTEGER IXNSV (R)

The index of the nodeset variable. The first variable has an index of 1.

INTEGER IDNS (R)

The nodeset ID.

INTEGER NUMNOD (R)

The number of nodes in the given nodeset.

REAL VALNSV(*) (R)

Array of NUMNOD values of the IXNSVth nodeset variable for the nodeset with ID of IDNS at the ISTEPth time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

5.3.21 Read Nodeset Variable Values at a Time Step

The function `ex_get_nset_var` (or `EXGNSV` for Fortran) reads the values of a single nodeset variable for one nodeset at one time step. Memory must be allocated for the nodeset variable values array before this function is invoked.

Because nodeset variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_nset_var` returns a negative number; a warning will return a positive number. `EXGNSV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- variable does not exist for the desired nodeset.
- invalid nodeset.

`ex_get_nset_var`: C Interface

```
int ex_get_nset_var (exoid, time_step, nset_var_index, nset_id,  
                    num_nodes_this_blk, nset_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number, as described under `ex_put_time`, at which the nodeset variable values are desired. This is essentially an index (in the time dimension) into the nodeset variable values array stored in the database. The first time step is 1.

int nset_var_index (R)

The index of the desired nodeset variable. The first variable has an index of 1.

int nset_blk_id (R)

The desired nodeset ID.

int num_nodes_this_blk (R)

The number of nodes in this nodeset.

void* nset_var_vals (W)

Returned array of num_nodes_this_blk values of the nset_var_indexth nodeset variable for the nodeset with ID of nset_id at the time_stepth time step.

EXGNSV: Fortran Interface

```
SUBROUTINE EXGNSV (IDEXO, ISTEP, IXNSV, IDNS, NUMNOD, VALNSV, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ISTEP (R)

The time step number, as described under EXPTIM, at which the nodeset variable is desired. This is essentially an index (in the time dimension) into the nodeset variable values array stored in the database. The first time step is 1.

INTEGER IXNSV (R)

The index of the desired nodeset variable. The first variable has an index of 1.

INTEGER IDNS (R)

The desired nodeset ID.

INTEGER NUMNOD (R)

The number of nodes in this nodeset.

REAL VALNSV(*) (W)

Returned array of NUMNOD values of the IXNSVth nodeset variable for the nodeset with ID of IDNS at the ISTEPth time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

5.3.22 Write Sideset Variable Truth Table

The function `ex_put_sset_var_tab` (or `EXPVTT` for Fortran) writes the EXODUS II sideset variable truth table to the database. The sideset variable truth table indicates whether a particular sideset result is written for the nodes in a particular sideset. A 0 (zero) entry indicates that no results will be output for that sideset variable for that sideset. A non-zero entry indicates that the appropriate results will be output.

Although writing the sideset variable truth table is optional, it is encouraged because it creates at one time all the necessary netCDF variables in which to hold the EXODUS sideset variable values. This results in significant time savings. See Appendix A for a discussion of efficiency issues. Calling the function `ex_put_var_tab` with an object type of "S" results in the same behavior as calling this function.

The function `ex_put_var_param` (or `EXPVP` for Fortran) must be called before this routine in order to define the number of sideset variables.

In case of an error, `ex_put_sset_var_tab` returns a negative number; a warning will return a positive number. `EXPVTT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the specified number of sidesets is different than the number specified in a call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_node_set` (or `EXPNS` for Fortran) not called previously to specify sideset parameters.
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously to specify the number of sideset variables or was called but with a different number of sideset variables.
- `ex_put_sset_var` previously called.

ex_put_sset_var_tab: C Interface

```
int ex_put_sset_var_tab (exoid, num_ssets, num_sset_var, sset_var_tab);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int num_sset (R)

The number of sidesets.

int num_sset_var (R)

The number of sideset variables.

```
int sset_var_tab[num_sset,num_sset_var] (R)
```

A 2-dimensional array (with the `num_sset_var` index cycling faster) containing the sideset variable truth table.

EXPSSTT: Fortran Interface

```
SUBROUTINE EXPSSTT (IDEXO, NUMSS NVARSS, ISSSVOK, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER NUMSS (R)

The number of sidesets.

INTEGER NVARSS (R)

The number of sideset variables.

INTEGER ISSSVOK(NVARSS,NUMSS) (R)

A 2-dimensional array (with the NVARSS index cycling faster) containing the sideset variable truth table.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

5.3.23 Read Sideset Variable Truth Table

The function `ex_get_sset_var_tab` (or `EXGSSTT` for Fortran) reads the EXODUS II sideset variable truth table from the database. For a description of the truth table, see the usage of the function `ex_put_sset_var_tab`. Memory must be allocated for the truth table (`num_sidesets * num_sset_var` in length) before this function is invoked. If the truth table is not stored in the file, it will be created based on information in the file and then returned. Calling the function `ex_get_var_tab` with an object type of “S” results in the same behavior as calling this function.

In case of an error, `ex_get_sset_var_tab` returns a negative number; a warning will return a positive number. `EXGSSTT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- the specified number of sidesets is different than the number specified in a call to `ex_put_init` (`EXPINI` for Fortran).
- there are no sideset variables stored in the file or the specified number of sideset variables doesn't match the number specified in a call to `ex_put_var_param` (or `EXPVP` for Fortran).

ex_get_sset_var_tab: C Interface

```
int ex_get_sset_var_tab (exoid, num_ssets, num_sset_var, sset_var_tab);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int num_ssets (R)

The number of sidesets.

int num_sset_var (R)

The number of sideset variables.

```
int sset_var_tab[num_ssets,num_sset_var] (W)
```

Returned 2-dimensional array (with the `num_sset_var` index cycling faster) containing the

sideset variable truth table.

EXGSSTT: Fortran Interface

```
SUBROUTINE EXGSSTT (IDEXO, NSSETS, NVARSS, ISSSVOK, IERR)
INTEGER IDEXO (R)
    EXODUS file ID returned from a previous call to EXCRE or EXOPEN.
INTEGER NSSETS (R)
    The number of sidesets.
INTEGER NVARSS (R)
    The number of sideset variables.
INTEGER ISSSVOK(NVARSS, NSSETS) (W)
    Returned 2-dimensional array (with the NVARSS index cycling faster) containing the sideset
    variable truth table.
INTEGER IERR (W)
    Returned error code. If no errors occurred, 0 is returned.
```

5.3.24 Write Sideset Variable Values at a Time Step

The function `ex_put_sset_var` (or `EXPSSV` for Fortran) writes the values of a single sideset variable for one sideset at one time step. It is recommended, but not required, to write the sideset variable truth table (with `ex_put_sset_var_tab` for C; `EXPSSTT` for Fortran) before this function is invoked for better efficiency. See Appendix A for a discussion of efficiency issues.

Because sideset variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_sset_var` returns a negative number; a warning will return a positive number. `EXPSSV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- invalid sideset ID.
- `ex_put_side_set` (or `EXPSS` for Fortran) not called previously to specify parameters for this sideset.
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously specifying the number of sideset variables.

- a sideset variable truth table was stored in the file but contains a zero (indicating no valid sideset variable) for the specified sideset and sideset variable.

ex_put_sset_var: C Interface

```
int ex_put_sset_var (exoid, time_step, sset_var_index, sset_id,
                    num_sides_this_blk, sset_var_vals);
```

int exoid (R)
EXODUS file ID returned from a previous call to ex_create or ex_open.

int time_step (R)
The time step number, as described under ex_put_time. This is essentially a counter that is incremented only when results variables are output. The first time step is 1.

int sset_var_index (R)
The index of the sideset variable. The first variable has an index of 1.

int sset_id (R)
The sideset ID.

int num_sides_this_blk (R)
The number of sides in the given sideset.

void* sset_var_vals (R)
Array of num_sides_this_blk values of the sset_var_indexth sideset variable for the sideset with ID of sset_id at the time_stepth time step.

EXPSSV: Fortran Interface

```
SUBROUTINE EXPSSV (IDEXO, ISTEP, IXSSV, IDSS, NUMSID, VALSSV, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ISTEP (R)
The time step number, as described under EXPTIM. This is essentially a counter that is incremented only when results variables are output. The first time step is 1.

INTEGER IXSSV (R)
The index of the sideset variable. The first variable has an index of 1.

INTEGER IDSS (R)
The sideset ID.

INTEGER NUMSID (R)
The number of sides in the given sideset.

REAL VALSSV(*) (R)
Array of NUMSID values of the IXSSVth sideset variable for the sideset with ID of IDSS at the ISTEPth time step.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

5.3.25 Read sideset Variable Values at a Time Step

The function `ex_get_sset_var` (or `EXGSSV` for Fortran) reads the values of a single sideset variable for one sideset at one time step. Memory must be allocated for the sideset variable values array before this function is invoked.

Because sideset variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_sset_var` returns a negative number; a warning will return a positive number. `EXGSSV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- variable does not exist for the desired sideset.
- invalid sideset.

ex_get_sset_var: C Interface

```
int ex_get_sset_var (exoid, time_step, sset_var_index, sset_id,  
                    num_sides_this_blk, sset_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number, as described under `ex_put_time`, at which the sideset variable values are desired. This is essentially an index (in the time dimension) into the sideset variable values array stored in the database. The first time step is 1.

int sset_var_index (R)

The index of the desired sideset variable. The first variable has an index of 1.

int sset_blk_id (R)

The desired sideset ID.

int num_sides_this_blk (R)

The number of sides in this sideset.

void* sset_var_vals (W)

Returned array of `num_sides_this_blk` values of the `sset_var_index`th sideset variable for the sideset with ID of `sset_id` at the `time_step`th time step.

EXGSSV: Fortran Interface

```
SUBROUTINE EXGSSV (IDEXO, ISTEP, IXSSV, IDSS, NUMSID, VALSSV, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ISTEP (R)

The time step number, as described under EXPTIM, at which the sideset variable is desired. This is essentially an index (in the time dimension) into the sideset variable values array stored in the database. The first time step is 1.

INTEGER IXSSV (R)

The index of the desired sideset variable. The first variable has an index of 1.

INTEGER IDSS (R)

The desired sideset ID.

INTEGER NUMSID (R)

The number of sides in this sideset.

REAL VALSSV(*) (W)

Returned array of NUMSID values of the IXSSVth sideset variable for the sideset with ID of IDSS at the ISTEPth time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

5.3.26 Write Global Variables Values at a Time Step

The function `ex_put_glob_vars` (or `EXPGV` for Fortran) writes the values of all the global variables for a single time step. The function `ex_put_var_param` (`EXPVP` for Fortran) must be invoked before this call is made.

Because global variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_glob_vars` returns a negative number; a warning will return a positive number. `EXPGV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously specifying the number of global variables.

ex_put_glob_vars: C Interface

```
int ex_put_glob_vars (exoid, time_step, num_glob_vars, glob_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number, as described under `ex_put_time`. This is essentially a counter that is incremented when results variables are output. The first time step is 1.

int num_glob_vars (R)

The number of global variables to be written to the database.

void* glob_var_vals (R)

Array of `num_glob_vars` global variable values for the `time_step`th time step.

As an example, the following coding will write the values of all the global variables at one time step to an open EXODUS II file:

```
int num_glo_vars, error, exoid, time_step;
float *glob_var_vals

/* write global variables */
for (j=0; j<num_glo_vars; j++)
    /* application code fills this array */
    glob_var_vals[j] = 10.0;

error = ex_put_glob_vars (exoid, time_step, num_glo_vars,
    glob_var_vals);
```

EXPGV: Fortran Interface

SUBROUTINE EXPGV (IDEXO, ISTEP, NVARGL, VALGV, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER ISTEP (R)

The time step number, as described under `EXPTIM`. This is essentially a counter that is incremented only when results variables are output. The first time step is 1.

INTEGER NVARGL (R)

The number of global variables to be written to the database.

REAL VALGV(*) (R)

Array of `NVARGL` global variable values for the `ISTEP`th time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

As an example, the following coding will write the values of all the global variables at one time step to an open EXODUS II file:

```
c NOTE:      MAXGVAR is the maximum number of global variables
c
c      integer num_glo_vars
c      real glob_var_vals(MAXGVAR)
c
```

```

c write all global variables for time step istep
c
    do 50 j = 1, num_glo_vars
c
c application code fills in this array
c
        glob_var_vals(j) = 10.0
50  continue

    call expgv (idexo, istep, num_glo_vars, glob_var_vals, ierr)

```

5.3.27 Read Global Variables Values at a Time Step

The function `ex_get_glob_vars` (or `EXGGV` for Fortran) reads the values of all the global variables for a single time step. Memory must be allocated for the global variables values array before this function is invoked.

Because global variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_glob_vars` returns a negative number; a warning will return a positive number. `EXGGV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- no global variables stored in the file.
- a warning value is returned if no global variables are stored in the file.

ex_get_glob_vars: C Interface

```

int ex_get_glob_vars (exoid, time_step, num_glob_vars, glob_var_vals);

```

`int exoid (R)`
EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

`int time_step (R)`
The time step, as described under `ex_put_time`, at which the global variable values are desired. This is essentially an index (in the time dimension) into the global variable values array stored in the database. The first time step is 1.

`int num_glob_vars (R)`
The number of global variables stored in the database.

`void* glob_var_vals (W)`
Returned array of `num_glob_vars` global variable values for the `time_step`th time step.

The following is an example code segment that reads all the global variables at one time step:

```
int num_glo_vars, error, time_step;
float *var_values;

error = ex_get_var_param (idexo, "g", &num_glo_vars);
var_values = (float *) calloc (num_glo_vars, sizeof(float));
error = ex_get_glob_vars (idexo, time_step, num_glo_vars, var_values);
```

EXGGV: Fortran Interface

```
SUBROUTINE EXGGV (IDEXO, ISTEP, NVARGL, VALGV, IERR)
```

INTEGER IDEXO (R)
EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ISTEP (R)
The time step number, as described under EXPTIM, at which global variables are desired. This is essentially an index (in the time dimension) into the global variable values array stored in the database. The first time step is 1.

INTEGER NVARGL (R)
The number of global variables stored in the database.

REAL VALGV(*) (W)
Returned array of NVARGL global variable values for the ISTEPth time step.

INTEGER IERR (W)
Returned error code. If no errors occurred, 0 is returned.

The following is an example code segment that reads all the global variables at one time step:

```
c NOTE: MAXGVAR is the maximum number of global variables
c real var_values(MAXGVAR)
c
c read all global variables at one time step
c
c call exggv (idexo, istep, num_glo_vars, var_values, ierr)
```

5.3.28 Read Global Variable Values through Time

The function `ex_get_glob_var_time` (or `EXGGVT` for Fortran) reads the values of a single global variable through a specified number of time steps. Memory must be allocated for the global variable values array before this function is invoked.

Because global variables are floating point values, the application code must declare the array passed to be the appropriate type ("float" or "double" in C; "REAL*4" or "REAL*8" in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_glob_var_time` returns a negative number; a warning will return a positive number. `EXGGVT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- specified global variable does not exist.
- a warning value is returned if no global variables are stored in the file.

ex_get_glob_var_time: C Interface

```
int ex_get_glob_var_time (exoid, glob_var_index, beg_time_step,
                          end_time_step, glob_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int glob_var_index (R)

The index of the desired global variable. The first variable has an index of 1.

int beg_time_step (R)

The beginning time step for which a global variable value is desired. This is not a time value but rather a time step number, as described under `ex_put_time`. The first time step is 1.

int end_time_step (R)

The last time step for which a global variable value is desired. If negative, the last time step in the database will be used. The first time step is 1.

void* glob_var_vals (W)

Returned array of $(\text{end_time_step} - \text{beg_time_step} + 1)$ values for the `glob_var_index`th global variable.

The following is an example of using this function:

```
#include "exodusII.h"
int error, exoid, num_time_steps, var_index, beg_time, end_time;
float *var_values;

/* determine how many time steps are stored */
error = ex_inquire (exoid, EX_INQ_TIME, &num_time_steps, &fdum, cdum);
/* read the first global variable for all time steps */

var_index = 1;
beg_time = 1;
end_time = -1;

var_values = (float *) calloc (num_time_steps, sizeof(float));

error = ex_get_glob_var_time (exoid, var_index, beg_time, end_time,
                              var_values);
```

EXGGVT: Fortran Interface

SUBROUTINE EXGGVT (IDEXO, IXGLOV, ITPB, ISTPE, VALGV, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER IXGLOV (R)

The index of the desired global variable. The first variable has an index of 1.

INTEGER ITPB (R)

The beginning time step for which a global variable value is desired. This is not a time value but rather a time step number, as described under EXPTIM. The first time step is 1.

INTEGER ISTPE (R)

The last time step for which a global variable value is desired. If negative, the last time step in the database will be used. The first time step is 1.

REAL VALGV(*) (W)

Returned array of (ISTPE - ITPB + 1) values for the IXGLOVth global variable.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

The following is an example of using this function:

```
c NOTE: MAXVAL is the maximum number of values to be read
c
c   integer var_index, beg_time, end_time
c   real var_values(MAXVAL)
c
c read a single global variable for all time steps
c
c   var_index = 1
c   beg_time = 1
c   end_time = -1
c   call exggvt (idexo, var_index, beg_time, end_time, var_values, ierr)
```

5.3.29 Write Nodal Variable Values at a Time Step

The function `ex_put_nodal_var` (or `EXPNV` for Fortran) writes the values of a single nodal variable for a single time step. The function `ex_put_var_param` (`EXPVP` for Fortran) must be invoked before this call is made.

Because nodal variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_put_nodal_var` returns a negative number; a warning will return a positive number. `EXPNV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- data file opened for read only.
- data file not initialized properly with call to `ex_put_init` (`EXPINI` for Fortran).
- `ex_put_var_param` (or `EXPVP` for Fortran) not called previously specifying the number of nodal variables.

ex_put_nodal_var: C Interface

```
int ex_put_nodal_var (exoid, time_step, nodal_var_index, num_nodes,
                     nodal_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int time_step (R)

The time step number, as described under `ex_put_time`. This is essentially a counter that is incremented when results variables are output. The first time step is 1.

int nodal_var_index (R)

The index of the nodal variable. The first variable has an index of 1.

int num_nodes (R)

The number of nodal points.

void* nodal_var_vals (R)

Array of `num_nodes` values of the `nodal_var_index`th nodal variable for the `time_step`th time step.

As an example, the following code segment writes all the nodal variables for a single time step:

```
int num_nod_vars, num_nodes, error, exoid, time_step;
float *nodal_var_vals;

/* write nodal variables */
nodal_var_vals = (float *) calloc (num_nodes, sizeof(float));

for (k=1; k<=num_nod_vars; k++) {
    for (j=0; j<num_nodes; j++)
        /* application code fills in this array */
        nodal_var_vals[j] = 10.0;

    error = ex_put_nodal_var (exoid, time_step, k, num_nodes,
                             nodal_var_vals);
}
```

EXPV: Fortran Interface

```
SUBROUTINE EXPV (IDEXO, ISTEP, IXNODV, NUMNP, VALNV, IERR)
```

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to EXCRE or EXOPEN.

INTEGER ISTEP (R)

The time step number, as described under EXPTIM. This is essentially a counter that is incremented when results variables are output. The first time step is 1.

INTEGER IXNODV (R)

The index of the nodal variable. The first variable has an index of 1.

INTEGER NUMNP (R)

The number of nodal points.

REAL VALNV(*) (R)

Array of NUMNP values of the IXNODVth nodal variable for the ISTEPth time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

As an example, the following code segment writes all the nodal variables for a single time step:

```
real nodal_var_vals (MAXNOD)

do 70 k = 1, num_nod_vars
  do 60 j = 1, num_nodes
c      simulation code fills in this array
      nodal_var_vals(j) = 10.0
60    continue

      call expnv (idexo, istep, k, num_nodes, nodal_var_vals, ierr)
70    continue
```

5.3.30 Read Nodal Variable Values at a Time Step

The function `ex_get_nodal_var` (or `EXGNV` for Fortran) reads the values of a single nodal variable for a single time step. Memory must be allocated for the nodal variable values array before this function is invoked.

Because nodal variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_nodal_var` returns a negative number; a warning will return a positive number. `EXGNV` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- data file not properly opened with call to `ex_create` or `ex_open` (`EXCRE` or `EXOPEN` for Fortran).
- specified nodal variable does not exist.
- a warning value is returned if no nodal variables are stored in the file.

ex_get_nodal_var: C Interface

```
int ex_get_nodal_var (exoid, int time_step, nodal_var_index, num_nodes,  
nodal_var_vals);
```

```
int exoid (R)
```

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

```
int time_step (R)
```

The time step, as described under `ex_put_time`, at which the nodal variable values are desired. This is essentially an index (in the time dimension) into the nodal variable values array stored in the database. The first time step is 1.

```
int nodal_var_index (R)
```

The index of the desired nodal variable. The first variable has an index of 1.

```
int num_nodes (R)
```

The number of nodal points.

```
void* nodal_var_vals (W)
```

Returned array of `num_nodes` values of the `nodal_var_index`th nodal variable for the `time_step`th time step.

For example, the following demonstrates how this function would be used:

```
int num_nodes, time_step, var_index;  
float *var_values;  
  
/* read the second nodal variable at the first time step */  
time_step = 1;  
var_index = 2;  
  
var_values = (float *) calloc (num_nodes, sizeof(float));  
  
error = ex_get_nodal_var (exoid, time_step, var_index, num_nodes,  
var_values);
```

EXGNV: Fortran Interface

```
SUBROUTINE EXGNV (IDEXO, ISTEP, IXNODV, NUMNP, VALNV, IERR)
```

```
INTEGER IDEXO (R)
```

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

```
INTEGER ISTEP (R)
```

The time step number, as described under `EXPTIM`, at which the nodal variable is desired. This is essentially an index (in the time dimension) into the nodal variable values array stored in the database. The first time step is 1.

```
INTEGER IXNODV (R)
```

The index of the desired nodal variable. The first variable has an index of 1.

INTEGER NUMNP (R)

The number of nodal points.

REAL VALNV(*) (W)

Returned array of NUMNP values of the IXNODVth nodal variable for the ISTEPth time step.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For example, the following demonstrates how this function would be used:

```
c NOTE: MAXNOD is the maximum number of nodes for the model
c
c     integer var_index
c     real var_values (MAXNOD)
c
c read a nodal variable at one time step
c
c     istep = 10
c     var_index = 2
c     num_nodes = 1000
c
c     call exgnv (idexo, istep, var_index, num_nodes, var_values, ierr)
```

5.3.31 Read Nodal Variable Values through Time

The function `ex_get_nodal_var_time` (or `EXGNVT` for Fortran) reads the values of a nodal variable for a single node through a specified number of time steps. Memory must be allocated for the nodal variable values array before this function is invoked.

Because nodal variables are floating point values, the application code must declare the array passed to be the appropriate type (“float” or “double” in C; “REAL*4” or “REAL*8” in Fortran) to match the compute word size passed in `ex_create` (or `EXCRE` for Fortran) or `ex_open` (or `EXOPEN` for Fortran).

In case of an error, `ex_get_nodal_var_time` returns a negative number; a warning will return a positive number. `EXGNVT` returns a nonzero error (negative) or warning (positive) number in `IERR`. Possible causes of errors include:

- specified nodal variable does not exist.
- a warning value is returned if no nodal variables are stored in the file.

ex_get_nodal_var_time: C Interface

```
int ex_get_nodal_var_time (exoid, nodal_var_index, node_number,
    beg_time_step, end_time_step, nodal_var_vals);
```

int exoid (R)

EXODUS file ID returned from a previous call to `ex_create` or `ex_open`.

int nodal_var_index (R)

The index of the desired nodal variable. The first variable has an index of 1.

int node_number (R)

The internal ID (see Node Number Map) of the desired node. The first node is 1.

int beg_time_step (R)

The beginning time step for which a nodal variable value is desired. This is not a time value but rather a time step number, as described under `ex_put_time`. The first time step is 1.

int end_time_step (R)

The last time step for which a nodal variable value is desired. If negative, the last time step in the database will be used. The first time step is 1.

void* nodal_var_vals (W)

Returned array of $(\text{end_time_step} - \text{beg_time_step} + 1)$ values of the `node_numberth` node for the `nodal_var_indexth` nodal variable.

For example, the following code segment will read the values of the first nodal variable for node number one for all time steps stored in the data file:

```
#include "exodusII.h"
int num_time_steps, var_index, node_num, beg_time, end_time, error,
    exoid;
float *var_values;

/* determine how many time steps are stored */
error = ex_inquire (exoid, EX_INQ_TIME, &num_time_steps, &fdum, cdum);

/* read a nodal variable through time */
var_values = (float *) calloc (num_time_steps, sizeof(float));

var_index = 1; node_num = 1; beg_time = 1; end_time = -1;
error = ex_get_nodal_var_time (exoid, var_index, node_num, beg_time,
    end_time, var_values);
```

EXGNVT: Fortran Interface

SUBROUTINE EXGNVT (IDEXO, IXNODV, NODNUM, ITPB, ISTPE, VALNV, IERR)

INTEGER IDEXO (R)

EXODUS file ID returned from a previous call to `EXCRE` or `EXOPEN`.

INTEGER IXNODV (R)

The index of the desired nodal variable. The first variable has an index of 1.

INTEGER NODNUM (R)

The internal ID (see Node Number Map) of the desired node. The first node is 1.

INTEGER ITPB (R)

The beginning time step for which a nodal variable value is desired. This is not a time value but rather a time step number, as described under `EXPTIM`. The first time step is 1.

INTEGER ISTPE (R)

The last time step for which a nodal variable value is desired. If negative, the last time step in the database will be used. The first time step is 1.

REAL VALNV(*) (W)

Returned array of (ISTPE - ISTEPB + 1) values of the NODNUMth node for the IXNODVth nodal variable.

INTEGER IERR (W)

Returned error code. If no errors occurred, 0 is returned.

For example, the following code segment will read the values of the first nodal variable for node number one for all time steps stored in the data file:

```
integer var_ind, btime, etime
real var_vals(MAXVAL)
c
c read a nodal variable through time
c
var_ind = 1
node_num = 1
btime = 1
etime = -1
call exgnvt (idexo, var_ind, node_num, btime, etime, var_vals, ierr)
```

Appendix A. Implementation of EXODUS II with netCDF

Description

The netCDF software is an I/O library, callable from C or Fortran, which stores and retrieves scientific data structures in self-describing, machine-independent files. “Self-describing” means that a file includes information defining the data it contains. “Machine-independent” means that a file is represented in a form that can be accessed by computers with different ways of storing integers, characters, and floating-point numbers. It is available via anonymous FTP from unidata.ucar.edu in the file `pub/netcdf/netcdf.tar.Z`.

For the EXODUS II implementation, the standard netCDF distribution is used except that the following defined constants in the include file `netcdf.h` are modified to the values shown:

```
#define NC_MAX_DIMS 65536  
  
#define NC_MAX_VARS 524288  
  
#define NC_MAX_VAR_DIMS 8
```

Efficiency Issues

There are some efficiency concerns with using netCDF as the low level data handler. The main one is that whenever a new object is introduced, the file is put into “define” mode, the new object is defined, and then the file is taken out of “define” mode. A result of going in and out of “define” mode is that all of the data that was output previous to the introduction of the new object is copied to a new file. Obviously, this copying of data to a new file is very inefficient. We have attempted to minimize the number of times the data file is put into “define” mode by accumulating objects within a single EXODUS II API function. Thus using optional features such as the element variable truth table, concatenated node and side sets, and writing all property array names with `ex_put_prop_names` (EXPPN for Fortran) will increase efficiency significantly.

netCDF Data Objects

This section describes how EXODUS II data are mapped to netCDF entities. This information is needed only for those individuals who desire to access an EXODUS II database via netCDF calls directly or desire to modify the routines that comprise the Application Programming Interface (API).

The following is a list of the names of the data entities found in an EXODUS II file and a description of each entity. The names are constants predefined in the include file `exodusII_int.h` for C or `exodusII_int.inc` for Fortran. They are grouped into three netCDF categories: attributes, dimensions, and variables.

Attributes

An attribute is used to describe data entities. It can be global (describe entire file) or attached to a dimension or variable.

title	the database title; character global attribute
version	the EXODUS II file version number; float global attribute
api_version	the EXODUS II API version number; float global attribute
floating_point_word_size	word size of floating point numbers in the file; int global attribute
file_size	the database format. If it is missing or if equal to zero, then it is the “normal format”. If equal to 1, it is “large model format”.
elem_type	element type names for each element block; character variable attribute attached to connect variable
name	name of element block, node set, or side set property; character variable attribute attached to specific property

Dimensions

A dimension is an integer scalar value that is used to define the size of variables.

num_nodes	number of nodes
num_dim	number of dimensions of the finite element model; 1-, 2-, or 3-d
num_elem	number of elements
num_el_blk	number of element blocks
num_el_in_blk#	number of elements in element block #

num_nod_per_el#	number of nodes per element in element block #
num_att_in_blk#	number of attributes per element in element block #
num_side_sets	number of side sets
num_side_ss#	number of sides (also the number of elements) in side set #
num_df_ss#	number of distribution factors in side set #
num_node_sets	number of node sets
num_nod_ns#	number of nodes in node set #
num_df_ns#	number of distribution factors in node set #
num_qa_rec	number of QA records
num_info	number of information records
num_glo_var	number of global variables
num_nod_var	number of nodal variables
num_elem_var	number of element variables
num_ns_var	number of nodeset variables
num_ss_var	number of sideset variables
time_step	unlimited (expandable) dimension for time steps
len_string	length of a string; currently set to allow 32 characters (plus NULL character for C interface)
len_line	length of a line; currently set to allow 80 characters (plus NULL character for C interface)

Variables

A variable is an entity that contains data. Its size and shape are specified by dimensions. Note that the order of the dimensions is “row order” as implemented in the C language, so the last dimension specified varies fastest, the first dimension varies slowest. For multi-dimension variables, illustrations are included in the descriptions below for ease of understanding. For variables that are dimensioned through time, ellipses (. . .) are used to show that the variable can expand in that dimension.

For file_size=0: coord (num_dim, num_nodes)
nodal coordinates; float or double

For file_size=1: coordx (num_nodes), coordy (num_nodes), coordz (num_nodes) (If num_dim==3)
nodal coordinates; float or double

coord_names (num_dim, len_string)
names of coordinates; character

connect# (num_el_in_blk#, num_nod_per_el#)
 element connectivity for element block #; integer

attrib# (num_el_in_blk#, num_att_in_blk#)
 list of attributes for element block #; float or double

eb_prop# (num_el_blk)
 list of the #th property for all element blocks; integer

elem_map (num_elem)
 element order map; integer

dist_fact_ss# (num_df_ss#)
distribution factors for each node in side set #; float or double

elem_ss# (num_side_ss#)
list of elements in side set #; integer

side_ss# (num_side_ss#)
list of sides in side set #; integer

ss_prop# (num_side_sets)
list of the #th property for all side sets; integer

node_ns# (num_nod_ns#)
list of nodes in node set #; integer

dist_fact_ns# (num_nod_ns#)
list of distribution factors in node set #; float or double

ns_prop# (num_node_sets)
list of the #th property for all node sets; integer

qa_records (num_qa_rec, 4, len_string)
QA records; character

info_records (num_info, len_line)
information records; character

time_whole (time_step)
simulation times for time steps; float or double

elem_var_tab (num_el_blk, num_elem_var)
element variable truth table; integer

num_el_blk

num_elem_var

name_glo_var (num_glo_var, len_string)
names of global variables; character

num_glo_var

len_string

vals_glo_var (time_step, num_glo_var)
values of global variables; float or double

time_step

•
•
•

num_glo_var

```
name_nod_var (num_nod_var, len_string)
names of nodal variables; character
```

```
if file_size=0: vals_nod_var (time_step, num_nod_var, num_nodes)
values of nodal variables; float or double
```

```
if file_size=1: vals_nod_var#1 (time_step, num_nodes)
values of element variable #1; there is one of these for each nodal variable; float
or double
```

```
name_elem_var (num_elem_var, len_string)
names of element variables; character
```

num_elem_var

len_string

vals_elem_var#1eb#2 (time_step, num_el_in_blk#2)

values of element variable #1 in element block #2; for each element block, there is one of these for each element variable that is valid for that element block; float or double.

time_step

num_elem_in_blk#2

Appendix B. “Large Model” Modifications

The changes are to support the storage of larger models. There are two pieces of this. The first is the setting of the type of netcdf file that will be created; either one with 32-bit offsets or one with 64-bit offsets. This can be specified in a couple ways:

1. Pass the `EX_LARGE_MODEL` flag in the mode argument to `ex_create`.
2. Set the environment variable `EXODUS_LARGE_MODEL`.

If either of these are set, then the library will pass the `NC_64BIT_OFFSET` flag to the netcdf library. See the netcdf library documentation for more details.

The other change is to reduce the size of some of the datasets in an exodusII library. Even with the netcdf changes, the maximum dataset size is still 2GB. To reduce the size of the datasets, the nodal coordinates and the nodal variables have been split to store by component.

- The old behavior stored all x, y, and z coordinates in a single dataset; in the new behavior, each component is stored separately -- there is a `coordx`, `coordy`, and `coordz` dataset.
- The nodal variables used to be stored in a single blob of dimension (#times,#nodes,#variables). This has now been split into #variable datasets of size (#times,#nodes).

These two changes should increase the maximum model sizes significantly. Prior to the change, the maximum number of nodes that could be stored in the coordinate dataset was about 90 Million nodes; the new storage permits 270 Million nodes in double precision. The old model was more restrictive if there were multiple nodal variables, but the new storage should not depend on the number of nodal variables.

These changes were made such that the new library would create old-style files by default and would read either old or new style files.

An additional attribute is now written to the file. It is called "file_size" or `ATT_FILESIZE`. If it is 0 or not present, then the old format is assumed; if it is 1, then the new format is assumed.

There is also a new internal function called `ex_large_model(int exoid)` which will return 1 if new version; 0 if old version.

If the function is passed a negative exoid, then it will check the environment variable "EXODUS_LARGE_MODEL" and return 1 if it is defined. It also currently prints a warning message saying that the large model size was selected via the environment variable.

If you are using the exodusII api, then the only change to the client application is the passing of the `EX_LARGE_MODEL` flag to `ex_create` or the setting of the `EXODUS_LARGE_MODEL` environment variable. If your client application is reading the database, no changes are needed.

Internal Changes to support larger models

If your client application bypasses some or all of the exodusII API and makes direct netcdf calls, you will need to modify the calls. The changes that were made are shown below along with the name of the exodusII API function in which the changes were made.

ex_create:

- Check whether the `EX_LARGE_MODEL` mode was set. If so, then the mode passed to `nccreate` must have the `NC_64BIT_OFFSET` bit set. For example, "mode |= `NC_64BIT_OFFSET`;"
- Write the exodus file size "`ATT_FILESIZE`" attribute (1=large, 0=normal):
`filesiz = (nclong)((((cmode & EX_LARGE_MODEL) != 0) || (ex_large_model(-1) == 1)));`
`if (ncattput (exoid, NC_GLOBAL, ATT_FILESIZE, NC_LONG, 1, &filesiz) == -1)`
... handle errors...

ex_put_init:

If writing a "large model" capable database, then the coordinates are defined as components instead of an array. The variables are `VAR_COORD_X`, `VAR_COORD_Y` (if 2D or 3D), `VAR_COORD_Z` (if 3D). If not, define the `VAR_COORD` variable as is currently done.

```
if (ex_large_model(exoid) == 1) {
    /* node coordinate arrays -- separate storage... */
    dim[0] = numnoddim;
    if (ncvardef (exoid, VAR_COORD_X, ncflt_code(exoid), 1, dim) == -1)
        { ... handle error }

    if (num_dim > 1) {
        if (ncvardef (exoid, VAR_COORD_Y, ncflt_code(exoid), 1, dim) == -1)
            { ... handle error }
    }

    if (num_dim > 2) {
        if (ncvardef (exoid, VAR_COORD_Z, ncflt_code(exoid), 1, dim) == -1)
            { ... handle error }
    }
} else {
    /* node coordinate arrays: -- all stored together (old method) */
    .... define the old way...
}
```

ex_put_coord:

If writing a "large model" capable database, then the coordinates are written a component at a time, otherwise write the old way as a single blob.

```
if (ex_large_model(exoid) == 0) {
    ... write coordinates old way...
} else {
    if ((coordidx = ncvarid (exoid, VAR_COORD_X)) == -1)
        { ... handle error }

    if (num_dim > 1) {
        if ((coordidy = ncvarid (exoid, VAR_COORD_Y)) == -1)
            { ... handle error }
        } else {
            coordidy = 0;
        }
    if (num_dim > 2) {
        if ((coordidz = ncvarid (exoid, VAR_COORD_Z)) == -1)
            { ... handle error }
        } else {
            coordidz = 0;
        }
    /* write out the coordinates */
    for (i=0; i<= num_vars; i++) {
        dims[0] = time_dim;
        dims[1] = num_nod_dim;
        if ((ncvardef (exoid, VAR_NOD_VAR_NEW(i),
                      nc_flt_code(exoid), 2, dims)) == -1)
            { ... handle error ... }
    }
}
```

ex_put_nodal_var:

If the large model method, write the nodal variable data to the correct variable; if the old method, determine the location within the blob

```
if (ex_large_model(exoid) == 0) {
    /* write values of the nodal variable */
    if ((varid = ncvarid (exoid, VAR_NOD_VAR)) == -1) {
        ... handle error...
    }
    start[0] = --time_step;
    start[1] = --nodal_var_index;
```

```

start[2] = 0;

count[0] = 1;
count[1] = 1;
count[2] = num_nodes;
} else {
/* nodal variables stored separately, find variable for this variable
   index */
if ((varid = ncvrid (exoid, VAR_NOD_VAR_NEW(nodal_var_index))) == -1) {
    ... handle error ...
}

start[0] = --time_step;
start[1] = 0;

count[0] = 1;
count[1] = num_nodes;
}

if (ncvarput (exoid, varid, start, count,
ex_conv_array(exoid,WRITE_CONVERT,nodal_var_vals,num_nodes)) == -1) {
    ...handle error ...
}

```

There are similar modifications to the reading of the nodal coordinates and the reading of nodal variables.

Appendix C. Error Messages

This appendix contains descriptions of error codes that are returned by the EXODUS II library routines.

The following are return codes that are specific to EXODUS II routines. The error names are defined constants (in `exodusII.h` for C and `exodusII.inc` for Fortran) currently assigned the specified values. A 0 (zero) means no error; a positive number is a warning; a negative number is a fatal error.

Error Name (C)	Error Name (Fortran)	Value	Description
EX_FATAL	EXFATL	-1	fatal error flag
EX_OK	EXOK	0	no error flag
EX_WARN	EXWARN	1	warning flag
EX_MEMFAIL	EXMEMF	-100	memory allocation failure flag
EX_BADFILEMODE	EXBFMD	-101	bad file mode
EX_BADFILEID	EXBFID	-102	bad file id; usually an unopened file
EX_WRONGFILETYPE		-103	wrong file type for function
EX_LOOKUPFAIL	EXBTID	-104	property table lookup failed
EX_BADPARAM	EXBPRM	-105	bad parameter passed
EX_MSG	EXPMSG	100	user-defined message
EX_PRTLASTMSG	EXLMSG	101	print last error message msg code

The following are codes returned by netCDF functions. The error names are defined constants (in `netcdf.h`) currently set to the specified values.

Error Name	Value	Description
NC_NOERR	0	No error
NC_EBADID	-33	Not a netcdf id
NC_ENFILE	-34	Too many netcdfs open
NC_EEXIST	-35	netcdf file exists && NC_NOCLOBBER
NC_EINVAL	-36	Invalid argument
NC_EPERM	-37	Write to read only file
NC_ENOTINDEFINE	-38	Operation not allowed in data mode
NC_EINDEFINE	-39	Operation not allowed in define mode
NC_EINVALCOORDS	-40	Coordinates out of domain
NC_EMAXDIMS	-41	MAX_NC_DIMS (defined in netcdf.h) exceeded
NC_ENAMEINUSE	-42	String match to name in use
NC_ENOTATT	-43	Attribute not found
NC_EMAXATTRS	-44	MAX_NC_ATTRS (defined in netcdf.h) exceeded
NC_EBADTYPE	-45	Not a netcdf data type
NC_EBADDIM	-46	Invalid dimension id
NC_EUNLIMPOS	-47	NC_UNLIMITED in the wrong index
NC_EMAXVARS	-48	MAX_NC_VARS (defined in netcdf.h) exceeded
NC_ENOTVAR	-49	Variable not found

NC_EGLOBAL	-50	Action prohibited on NC_GLOBAL varid
NC_ENOTNC	-51	Not a netcdf file
NC_ESTS	-52	In Fortran, string too short
NC_EMAXNAME	-53	MAX_NC_NAME (defined in netcdf.h) exceeded
NC_EUNLIMIT	-54	NC_UNLIMITED size already in use
NC_ENORECVARS	-55	nc_rec op when there are no record vars
NC_ECHAR	-56	Attempt to convert between text & numbers
NC_EEDGE	-57	Edge+Start exceeds dimension bound
NC ESTRIDE	-58	Illegal stride
NC_EBADNAME	-59	Attribute or variable name contains illegal characters
NC_ERANGE	-60	Math result not representable
NC_ENOMEM	-61	Memory allocation (malloc) failure
NC_EVARSIZE	-62	One or more variable sizes violate format constraints
NC_EDIMSIZE	-63	Invalid dimension size

DRAFT

Appendix D. Sample Codes

This appendix contains examples of C and Fortran programs that use the EXODUS II API.

C Write Example Code

The following is a C program that creates and populates an EXODUS II file:

```
#include <stdio.h>
#include "netcdf.h"
#include "exodusII.h"

main ()
{
    int exoid, num_dim, num_nodes, num_elem, num_elem_blk;
    int num_elem_in_block[10], num_nodes_per_elem[10];
    int num_node_sets, num_sides, num_side_sets, error;
    int i, j, k, m, *elem_map, *connect;
    int node_list[100], elem_list[100], side_list[100];
    int ebids[10], ids[10];
    int num_sides_per_set[10], num_nodes_per_set[10], num_elem_per_set[10];
    int num_df_per_set[10];
    int df_ind[10], node_ind[10], elem_ind[10], side_ind[10];
    int num_qa_rec, num_info;
    int num_glo_vars, num_nod_vars, num_ele_vars;
    int *truth_tab;
    int whole_time_step, num_time_steps;
    int ndims, nvars, ngatts, recdim;
    int CPU_word_size, IO_word_size;
    int prop_array[2];

    float *glob_var_vals, *nodal_var_vals, *elem_var_vals;
    float time_value;
    float x[100], y[100], z[100], *dummy;
    float attrib[1], dist_fact[100];
    char *coord_names[3], *qa_record[2][4], *info[3], *var_names[3];
    char tmpstr[80];
    char *prop_names[2];

    dummy = 0; /* assign this so the Cray compiler doesn't complain */

    /* Specify compute and i/o word size */

    CPU_word_size = 0; /* float or double */
    IO_word_size = 0; /* use system default (4 bytes) */

    /* create EXODUS II file */

DRAFT

FORTRAN Write Example Code

The following Fortran program creates an EXODUS II file and populates it. Although this sample code does not conform entirely to the ANSI Fortran-77 standard (i.e., lengths of variable names, included files, etc.), it has successfully compiled and executed on all UNIX workstations we have attempted and is included only as an example.

```
      program testwt
c
c This is a test program for the Fortran binding of the EXODUS II
c database write routines.
c
      include 'exodusII.inc'
